

Statistical Machine Translation

Wei Xu

(many slides from Greg Durrett, Yoav Artzi)

Semester So-far

- ▶ Machine Learning Models
 - Linear models: Naive Bayes, Logistic Regression, SVM, Perceptron
 - Neural models: FeedForward Neural Networks, Back-prop, ...
- ▶ Sequence Models (NER, POS tagging, etc)
 - Hidden Markov Model, Viterbi Algorithm, Conditional Random Fields
- ▶ Word Embeddings
- ▶ Recurrent NN, Convolutional NN, Neural CRF

Rest of the Semester

- ▶ Applications in Natural Language Processing
 - Machine Translation
 - Information Extraction
 - Reading Comprehension
 - Automatic Summarization (if time)
 - Dialog System
 - Speech Recognition
 - etc.

- ▶ Some new advances in Natural Language Processing
 - Transformer model (June 2017 –)
 - Contextual Word Embeddings (2018 –)

This Lecture

- ▶ MT and evaluation
- ▶ Word alignment
- ▶ Language models
- ▶ Phrase-based decoders
- ▶ Syntax-based decoders

MT Basics

MT Basics

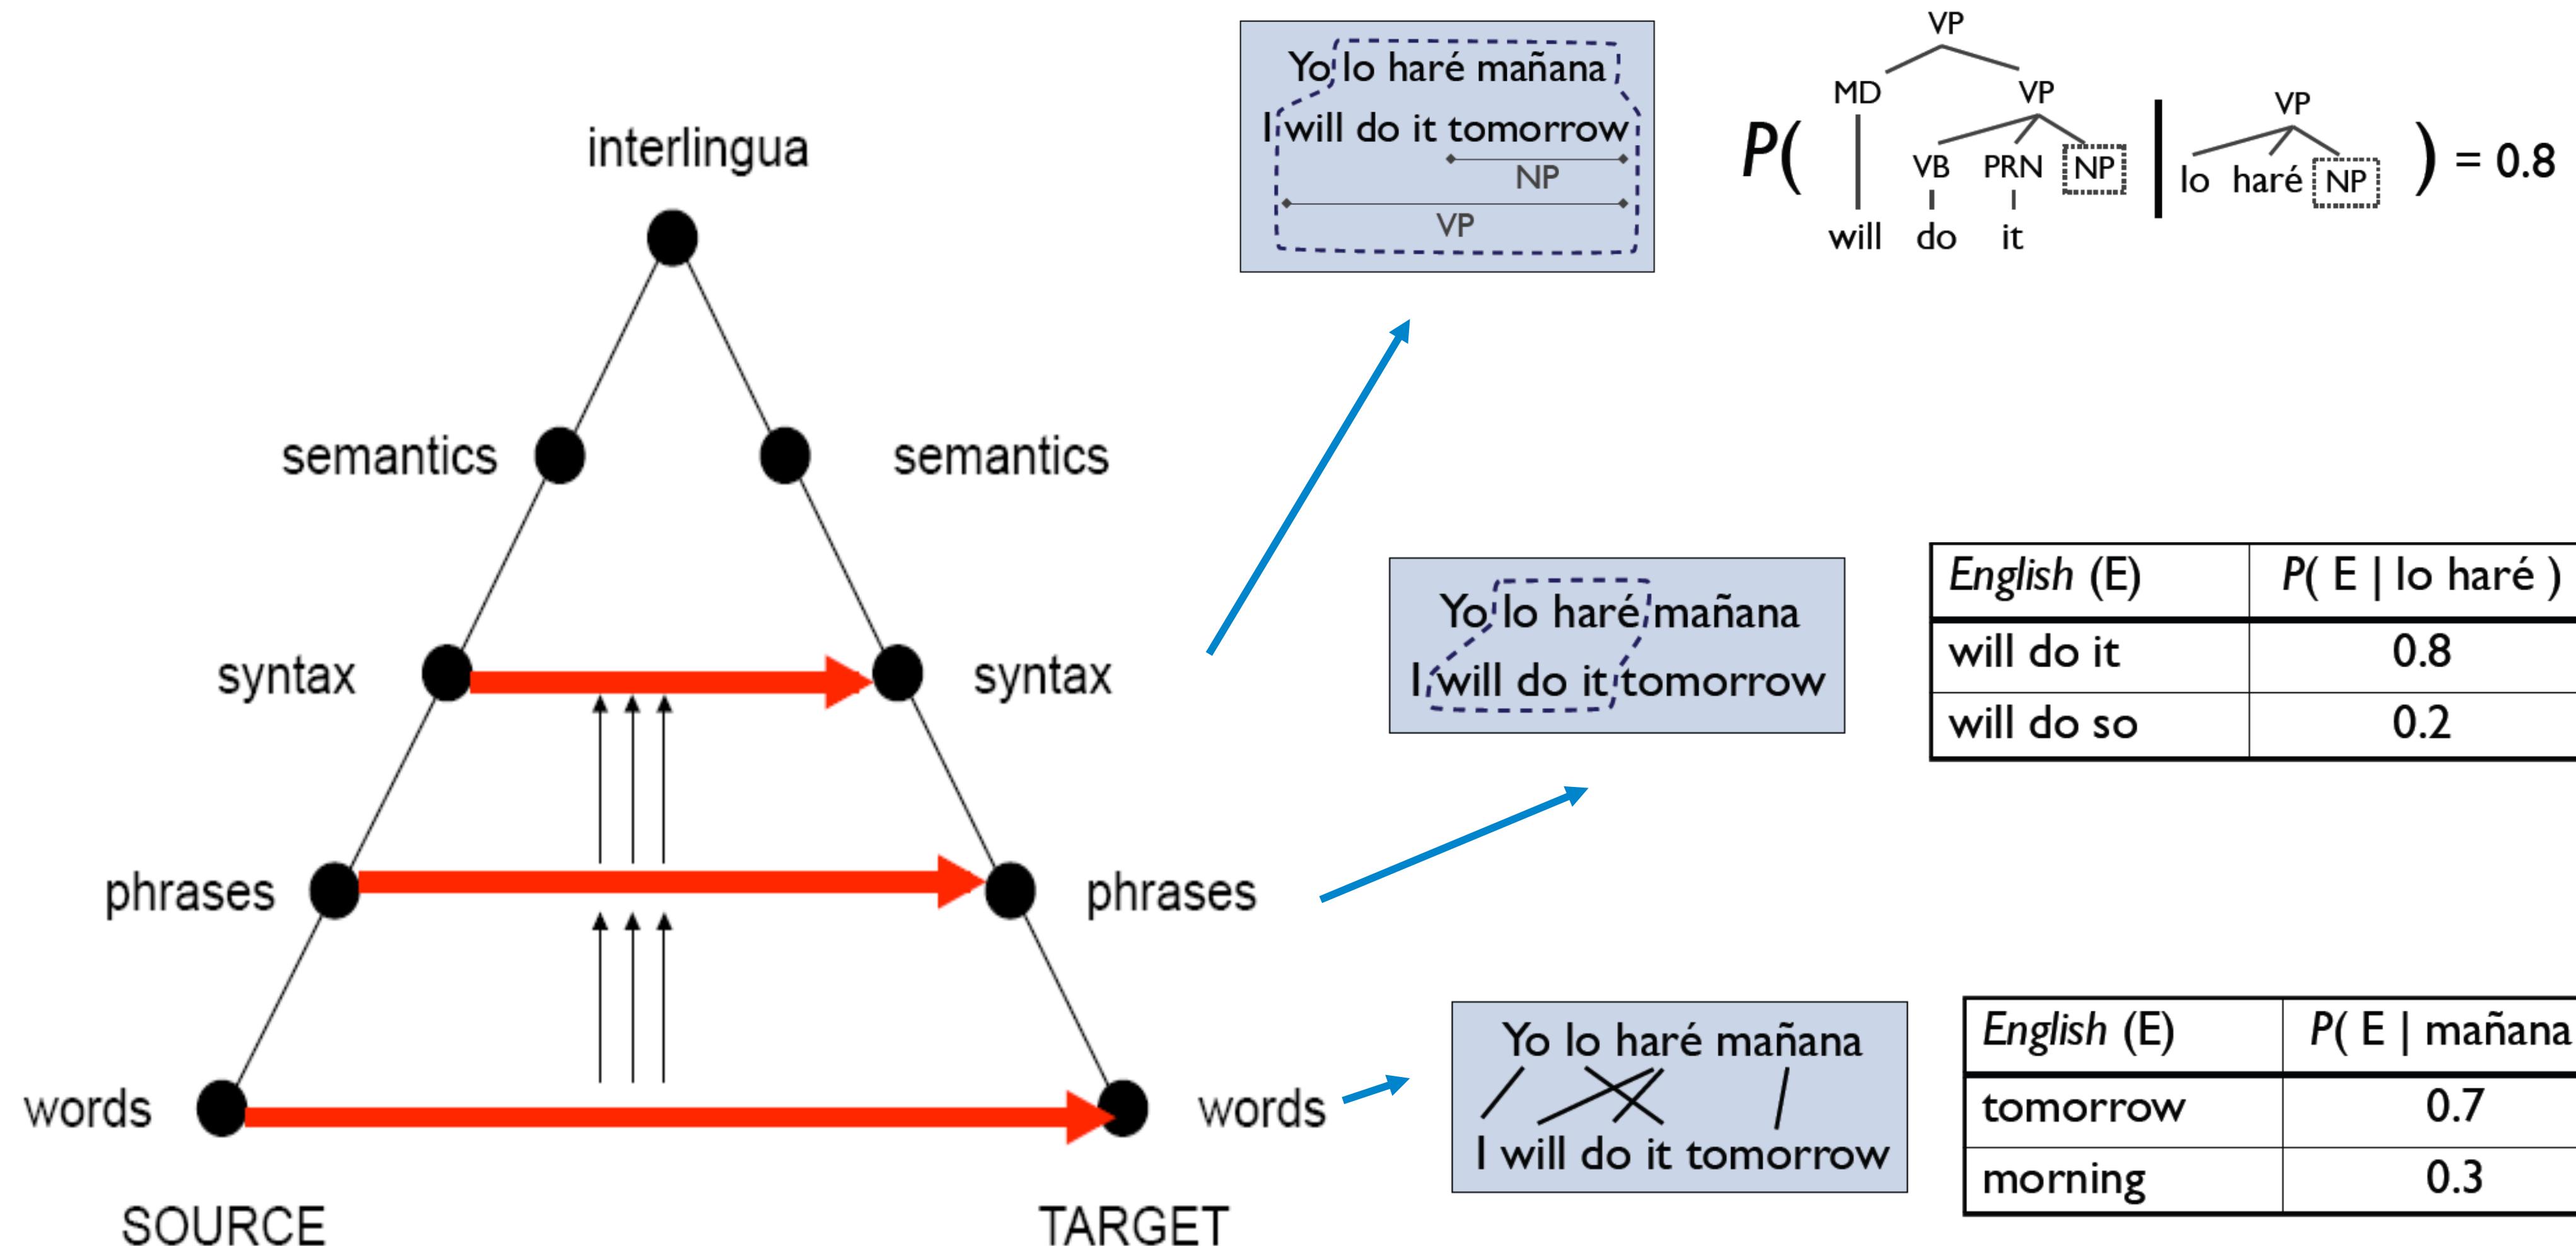

Trump Pope family watch a hundred years a year in the White House balcony

MT Ideally

- ▶ I have a friend => $\exists x \text{ friend}(x, \text{self})$ => J'ai un ami
J'ai une amie
- ▶ May need information you didn't think about in your representation
- ▶ Hard for semantic representations to cover everything
- ▶ Everyone has a friend => $\exists x \forall y \text{ friend}(x, y)$ => Tout le
 $\forall x \exists y \text{ friend}(x, y)$ monde a un ami
- ▶ Can often get away without doing all disambiguation — same ambiguities may exist in both languages

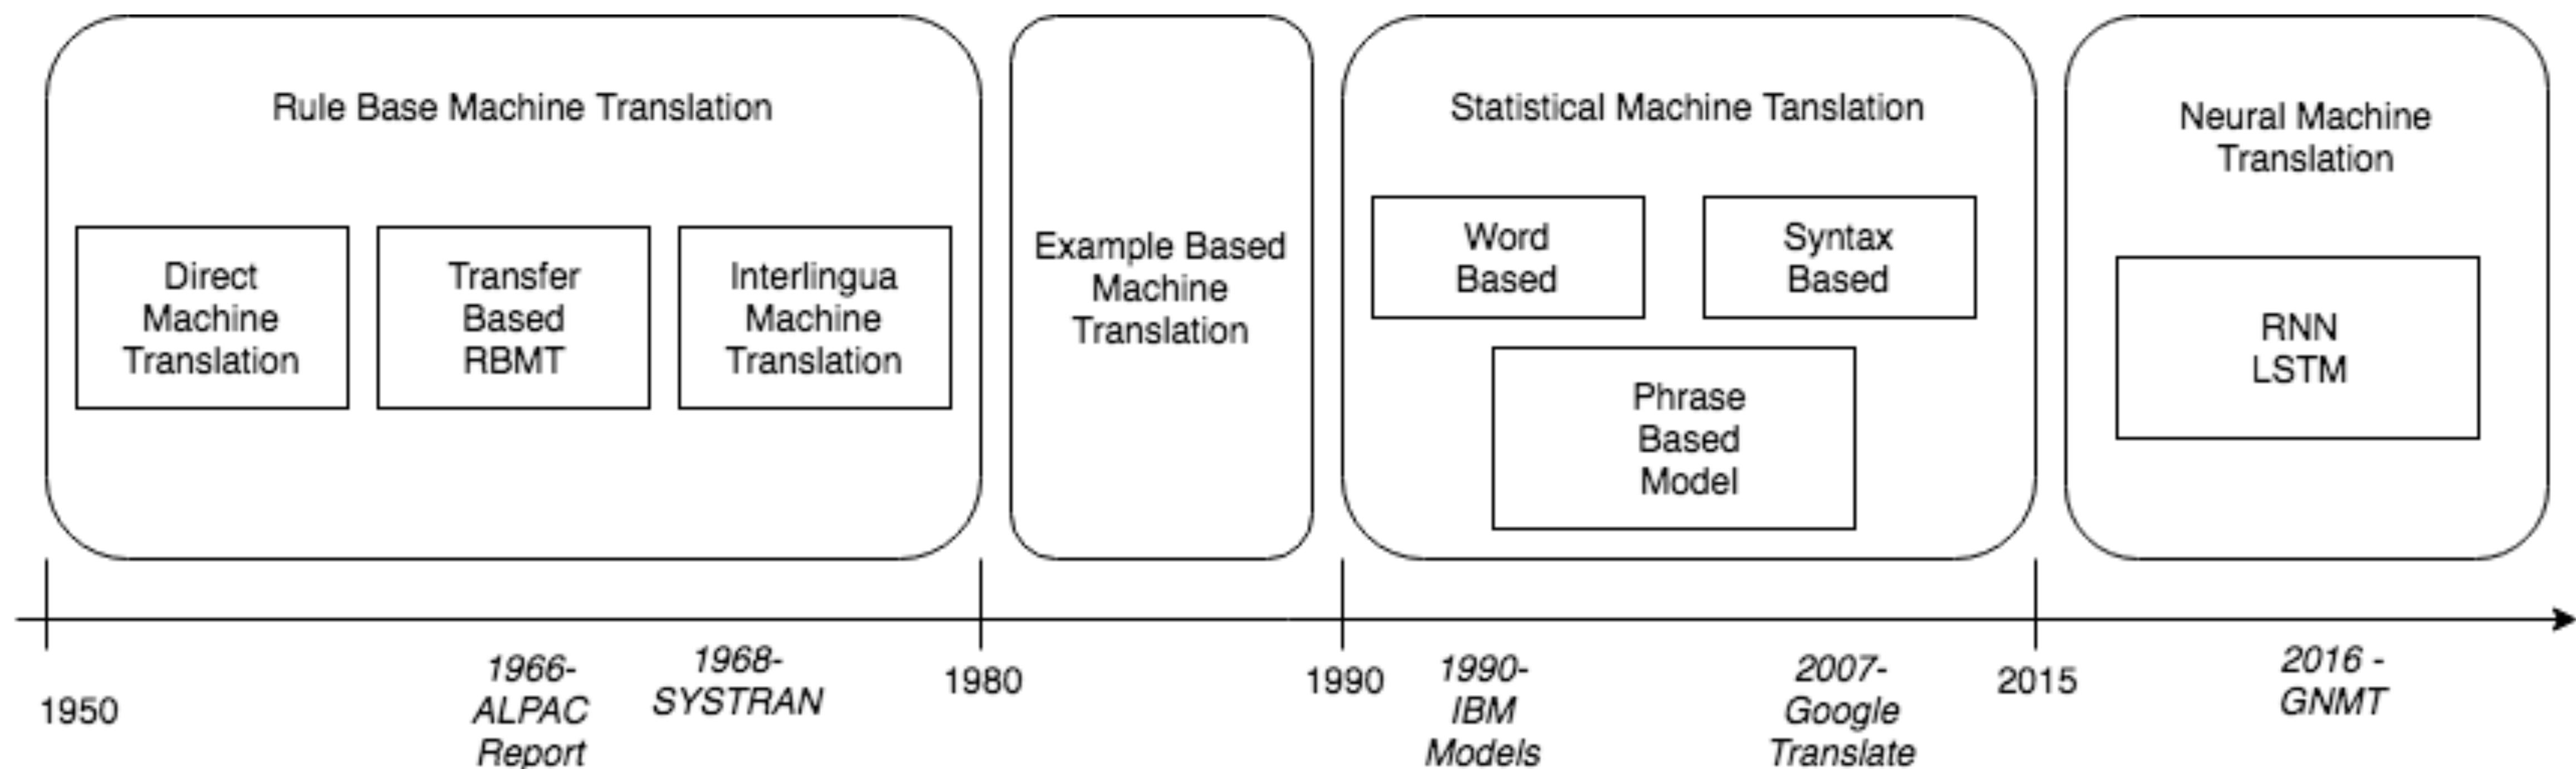

Levels of Transfer: Vauquois Triangle

► Today: mostly phrase-based, some syntax

Slide credit: Dan Klein

History of MT

Parallel Training Corpus

	facing with the swelling flow of through traffic zooming past their doors .		reclama de inconvenientes que mas y mas gente tiene que soportar por el tráfico que pasa por delante_de sus casas , que aumenta a_diario .
5	#77501757 Weekend traffic bans and traffic jams are a curse to road transport .	#74765580	Las prohibiciones de conducir los fines de semana y los embotellamientos asolan el transporte por carretera .
6	#79500725 Some people also want to recoup the cost of traffic jams from those who get stuck in them , according to the ' polluter pays ' principle .	#76764676	Algunos son partidarios de que incluso los costes ocasionados por los atascos se carguen a el ciudadano que se encuentra atrapado en ellos , de conformidad con el principio de que " quien contamina paga " .
7	#79500765 I think this is an excellent principle and I would like to see it applied in full , but not to traffic jams .	#76764713	Me parece un principio acertado y estoy dispuesta a aplicarlo íntegramente , pero no sobre los atascos , ya_que éstos son un claro indicio de el fracaso de la política gubernamental en_materia_de infraestructuras .
8	#79500768 Traffic jams are indicative of failed government policy on the infrastructure front , which is why the government itself , certainly in the Netherlands , must be regarded as the polluter .	#76764747	Por eso es preciso subrayar que en estos casos quien contamina es el propio Gobierno , a el menos en los Países_Bajos .
9	#81309716 This would increase traffic jams , weaken road safety and increase costs .	#78586130	Esto aumentaría los atascos , mermaría la seguridad vial e incrementaría los costes .
10	#81997391 In the previous legislature , Parliament gave its opinion on the Commission ' s proposals on the simplification of vertical directives on sugar , honey , fruit juices , milk and jams .	#79281114	En efecto , durante la precedente legislatura , el Parlamento se manifestó sobre las propuestas de la Comisión relativas a la simplificación de directivas verticales sobre el azúcar , la miel , los zumos de frutas , la leche y las confituras .
11	#81998167 For jams , I personally reintroduced an amendment that was not accepted by the Committee on the Environment , Public Health and Consumer Policy , but which I hold to .	#79281936	Para las confituras , yo personalmente volví a introducir una enmienda que no fue aceptada por la Comisión_de_Medio_Ambiente , Salud_Pública y Política_de_el_Consumidor , pero que es importante para mí .
12	#81998209 It concerns not accepting the general use of a chemical flavouring in jams and marmalades , that is vanillin .	#79281966	Se trata de no aceptar la utilización generalizada de un aroma químico en las confituras y " marmalades " , a saber , la vainillina .
13	#82800065 This is highlighted particularly in towns where it is necessary to find ways of solving environmental problems and the difficulties caused by traffic jams .	#80085988	Esto se pone_de_relieve aún más en las ciudades , en las que hay que encontrar medios para eliminar los inconvenientes derivados de los problemas medioambientales y de la congestión de el tráfico .

Evaluating MT

- ▶ Fluency: does it sound good in the target language?
- ▶ Fidelity/adequacy: does it capture the meaning of the original?
- ▶ BLEU score: geometric mean of 1-, 2-, 3-, and 4-gram precision vs. a reference, multiplied by brevity penalty

$$\text{BLEU} = \text{BP} \cdot \exp \left(\sum_{n=1}^N w_n \log p_n \right)$$

	hypothesis 1	hypothesis 2	hypothesis 3	reference 1	reference 2	1-gram	2-gram	3-gram
	I am exhausted	Tired is I	I I I	I am tired	I am ready to sleep now and so exhausted	3/3	1/2	0/1
						1/3	0/2	0/1
						1/3	0/2	0/1

Evaluating MT

- ▶ Fluency: does it sound good in the target language?
- ▶ Fidelity/adequacy: does it capture the meaning of the original?
- ▶ BLEU score: geometric mean of 1-, 2-, 3-, and 4-gram precision vs. a reference, multiplied by brevity penalty

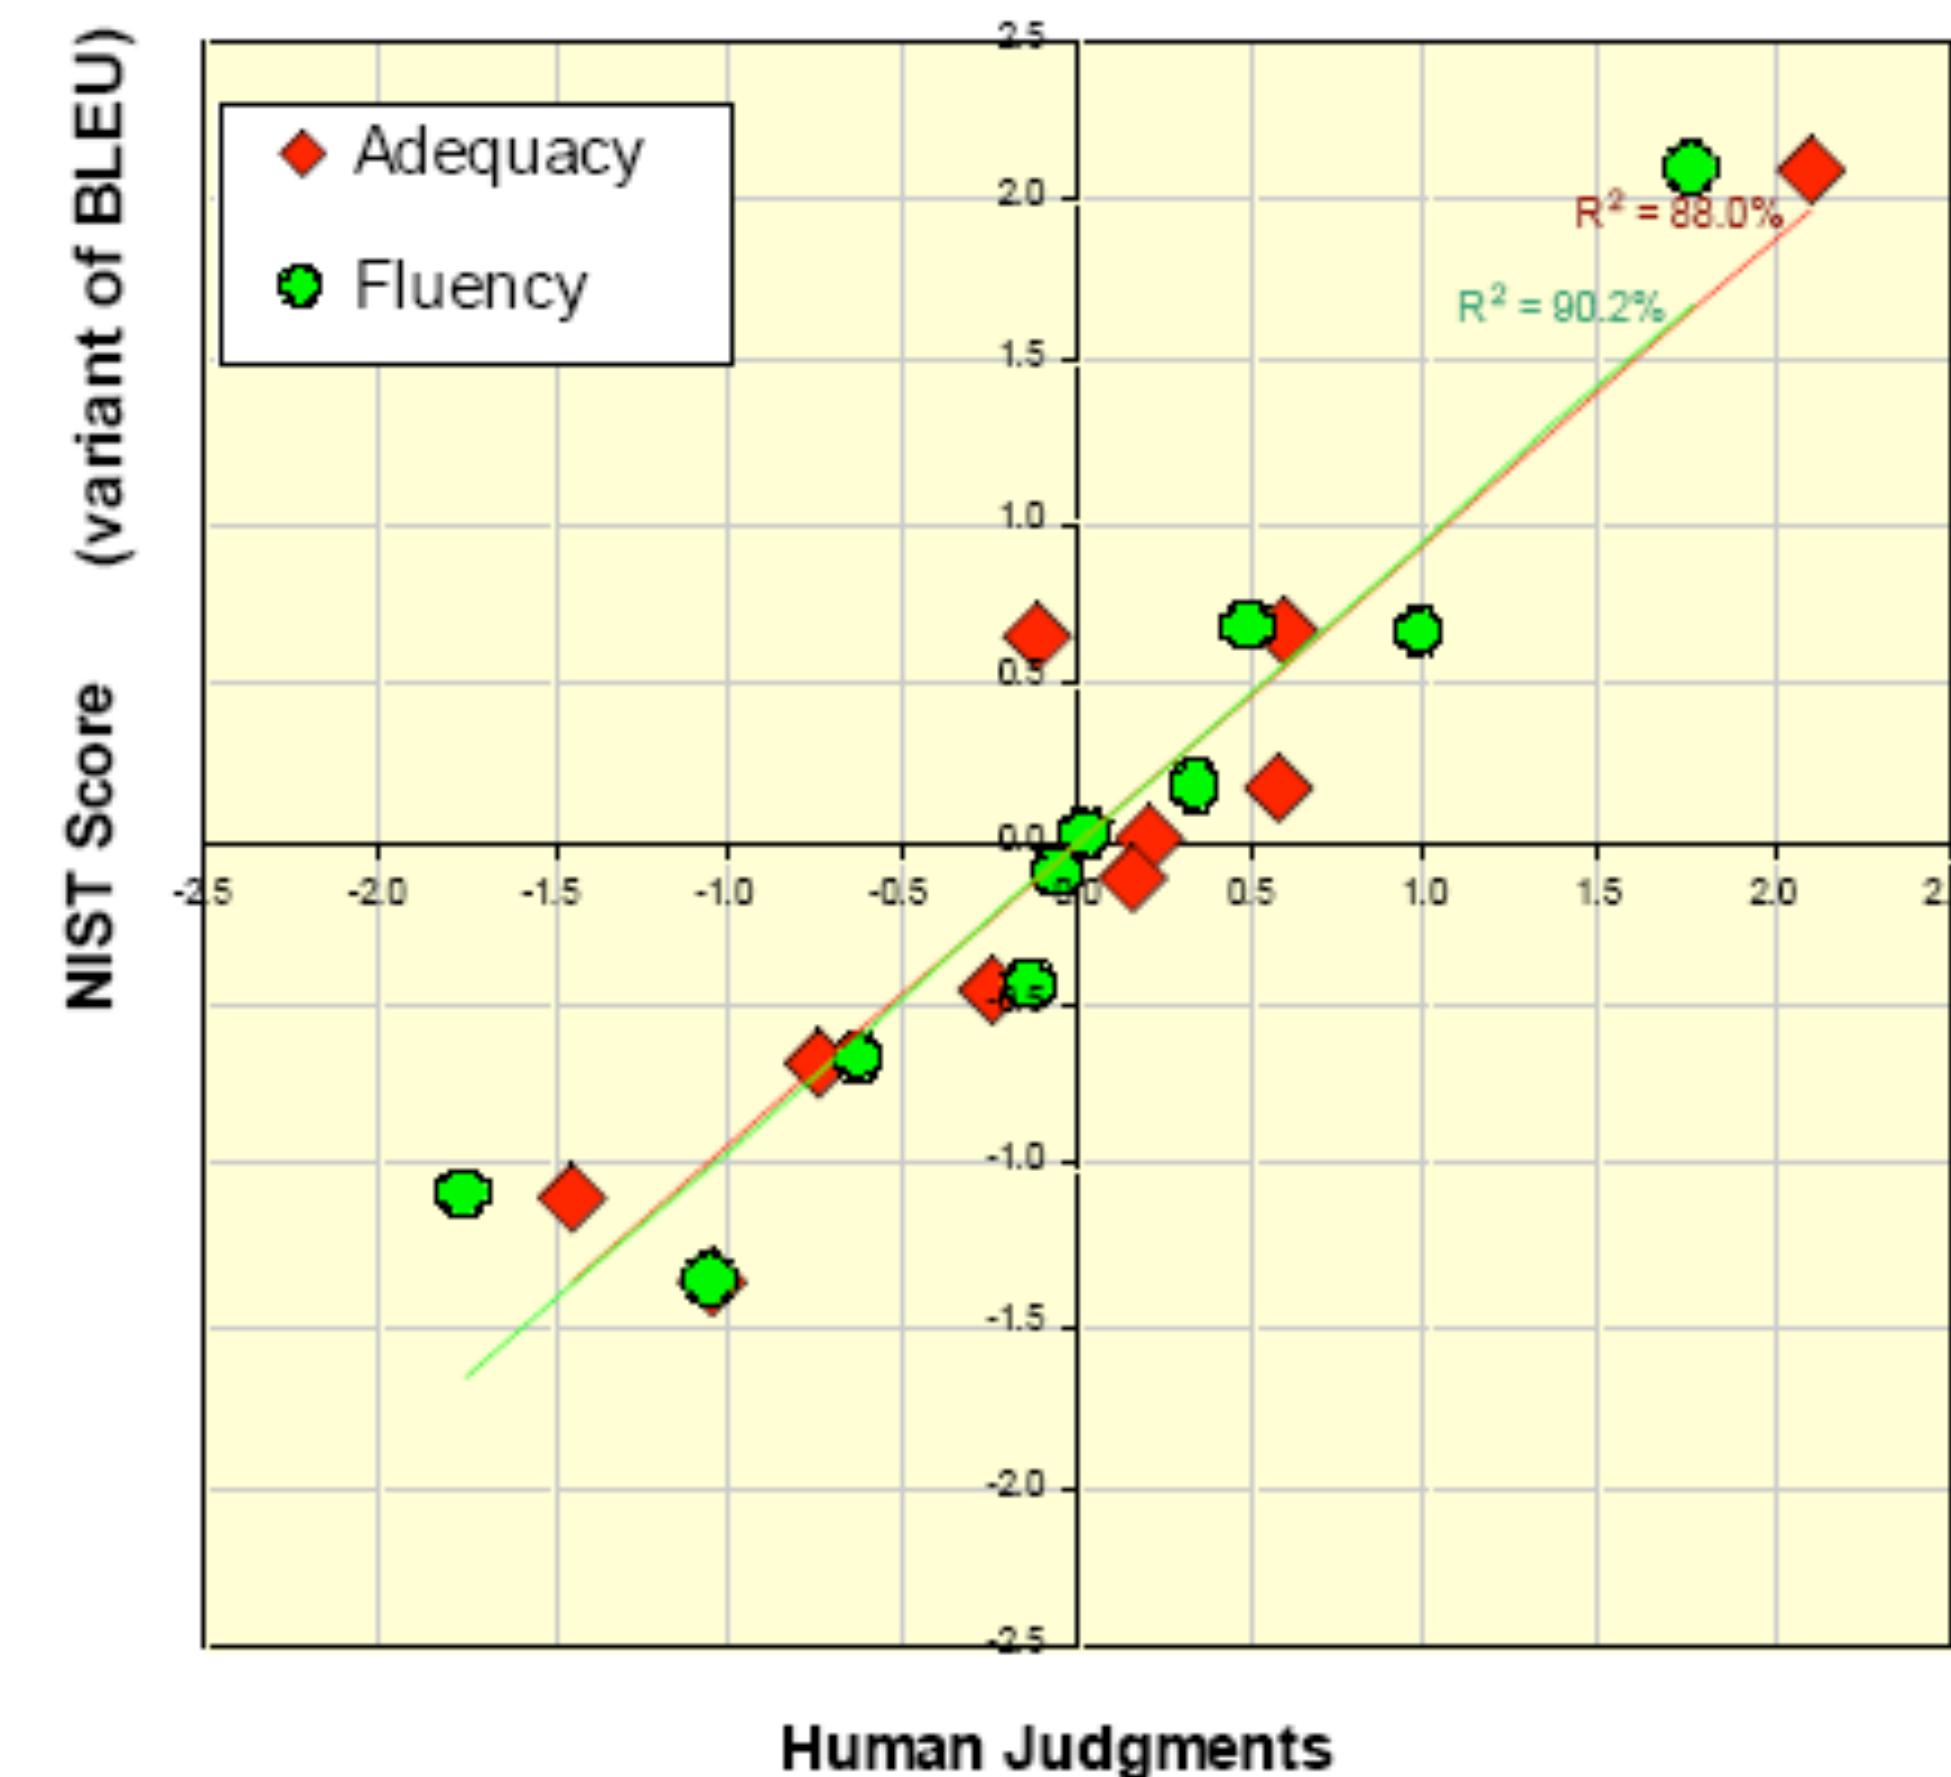

$$\text{BLEU} = \text{BP} \cdot \exp \left(\sum_{n=1}^N w_n \log p_n \right) \quad \blacktriangleright \text{Typically } n = 4, w_i = 1/4$$

$$\text{BP} = \begin{cases} 1 & \text{if } c > r \\ e^{(1-r/c)} & \text{if } c \leq r \end{cases} \quad \blacktriangleright r = \text{length of reference} \\ c = \text{length of system output}$$

- ▶ Does this capture fluency and adequacy?

BLEU Score

- ▶ Better methods with human-in-the-loop
- ▶ HTER: human-assisted translation error rate
- ▶ If you're building real MT systems, you do user studies.
In academia, you mostly use BLEU.

Appraise - Human Evaluation Interface

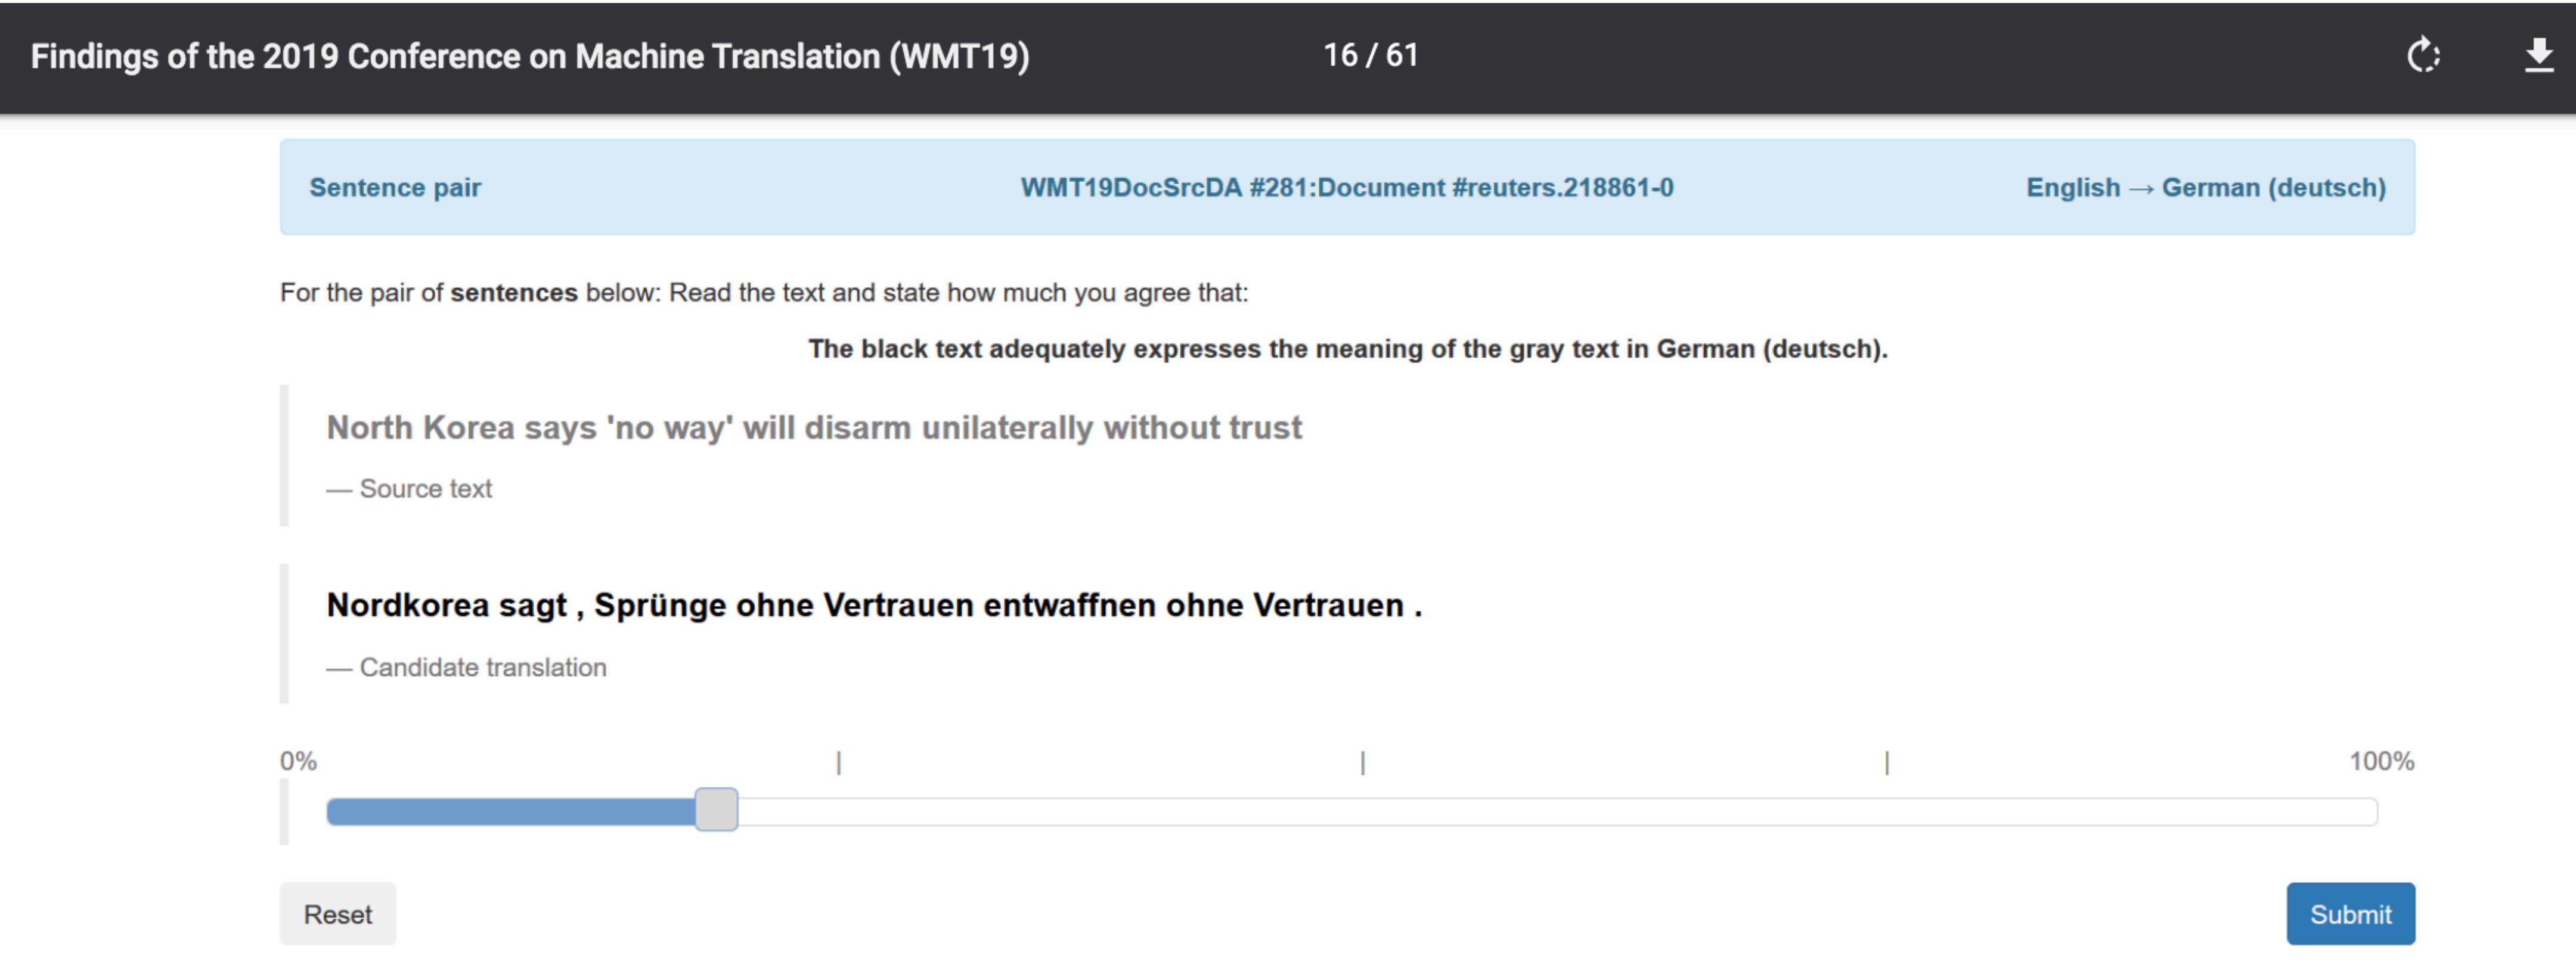

Figure 3: Screen shot of segment-rating portion of document-level direct assessment in the Appraise interface for an example English to German assessment from the human evaluation campaign. The annotator is presented with the machine translation output segment randomly selected from competing systems (anonymized) and is asked to rate the translation on a sliding scale.

Phrase-Based MT

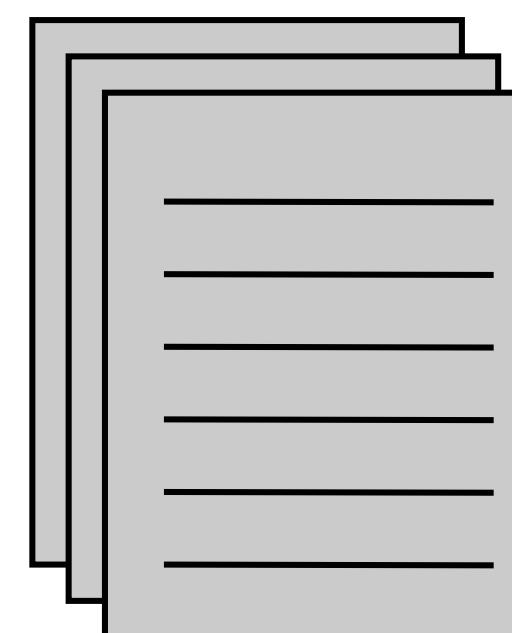

- ▶ Key idea: translation works better the bigger chunks you use
- ▶ Remember phrases from training data, translate piece-by-piece and stitch those pieces together to translate
 - ▶ How to identify phrases? Word alignment over source-target bitext
 - ▶ How to stitch together? Language model over target language
- ▶ Decoder takes phrases and a language model and searches over possible translations
- ▶ NOT like standard discriminative models (take a bunch of translation pairs, learn a ton of parameters in an end-to-end way)

Phrase-Based MT

- ▶ Goal: translate from Foreign language to English

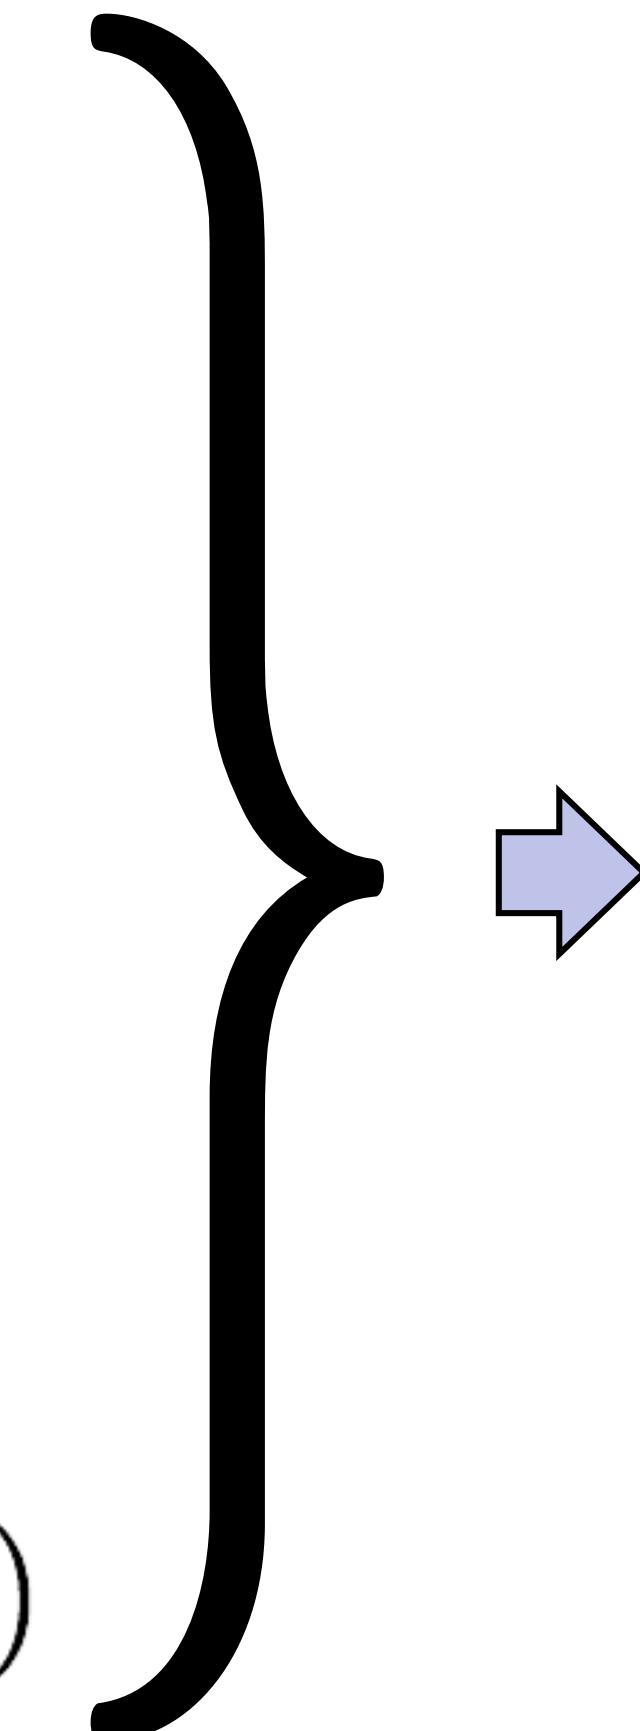

cat chat 0.9
the cat le chat 0.8
dog chien 0.8
house maison 0.6
my house ma maison 0.9
language langue 0.9
...

Phrase table $P(f|e)$

Unlabeled English data

Language model $P(e)$

$$P(e|f) \propto P(f|e)P(e)$$

Noisy channel model:
combine scores from
translation model +
language model to
translate foreign to
English

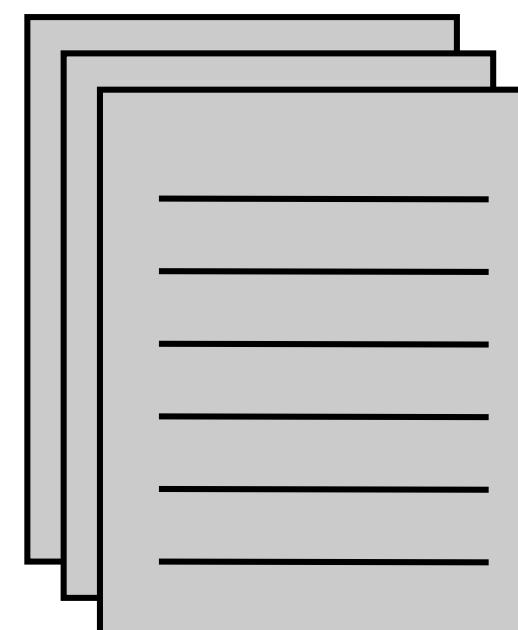

“Translate faithfully but make fluent English”

Phrase-Based MT

- ▶ Goal: translate from Foreign language to English

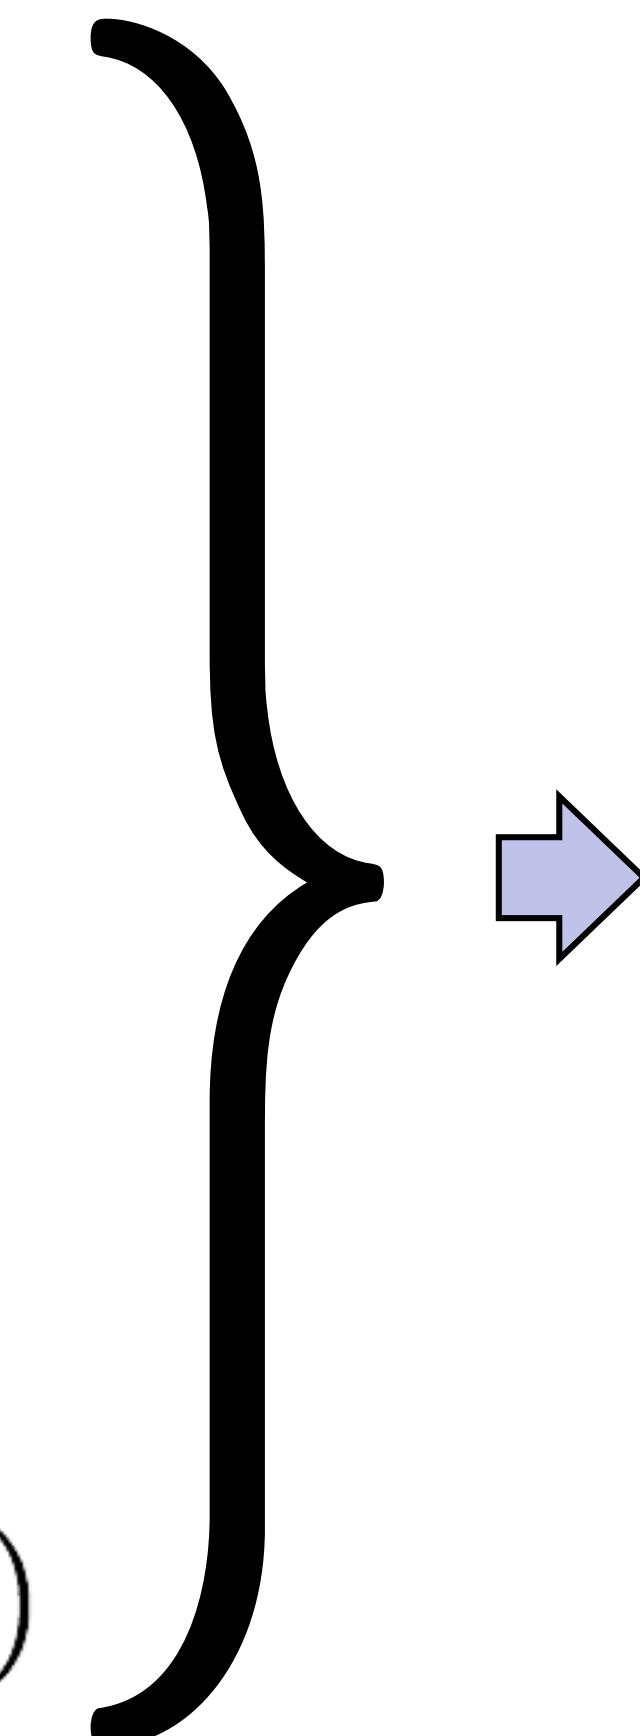

```
cat ||| chat ||| 0.9  
the cat ||| le chat ||| 0.8  
dog ||| chien ||| 0.8  
house ||| maison ||| 0.6  
my house ||| ma maison ||| 0.9  
language ||| langue ||| 0.9  
...
```

Phrase table $P(f|e)$

Unlabeled English data

Language model $P(e)$

$$P(e|f) \propto P(f|e)P(e)$$

Noisy channel model:
combine scores from
translation model +
language model to
translate foreign to
English

“Translate faithfully but make fluent English”

Word Alignment

Word Alignment

- ▶ Input: a bitext corpus, pairs of translated sentences

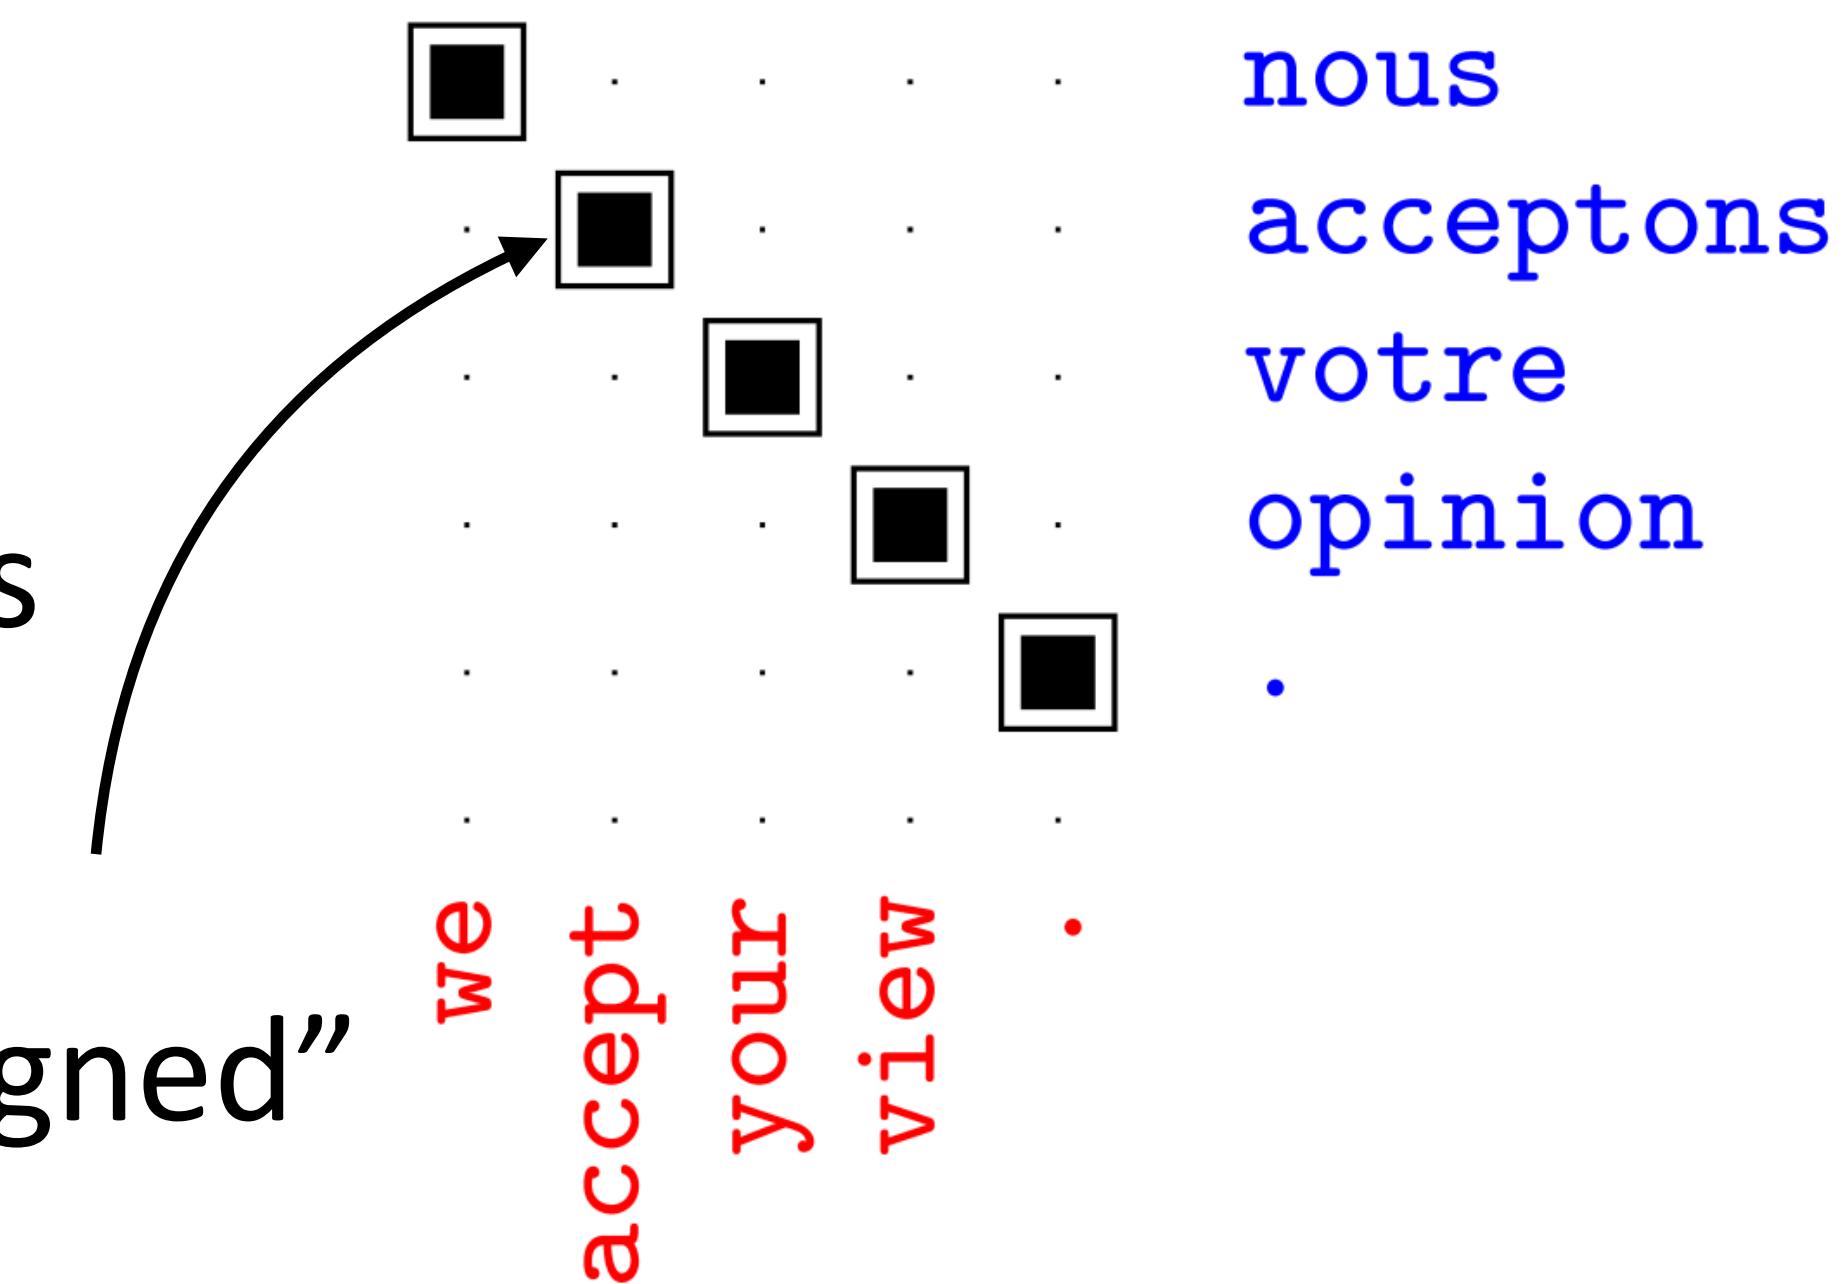

nous acceptons votre opinion . ||| we accept your view

nous allons changer d'avis ||| we are going to change our minds

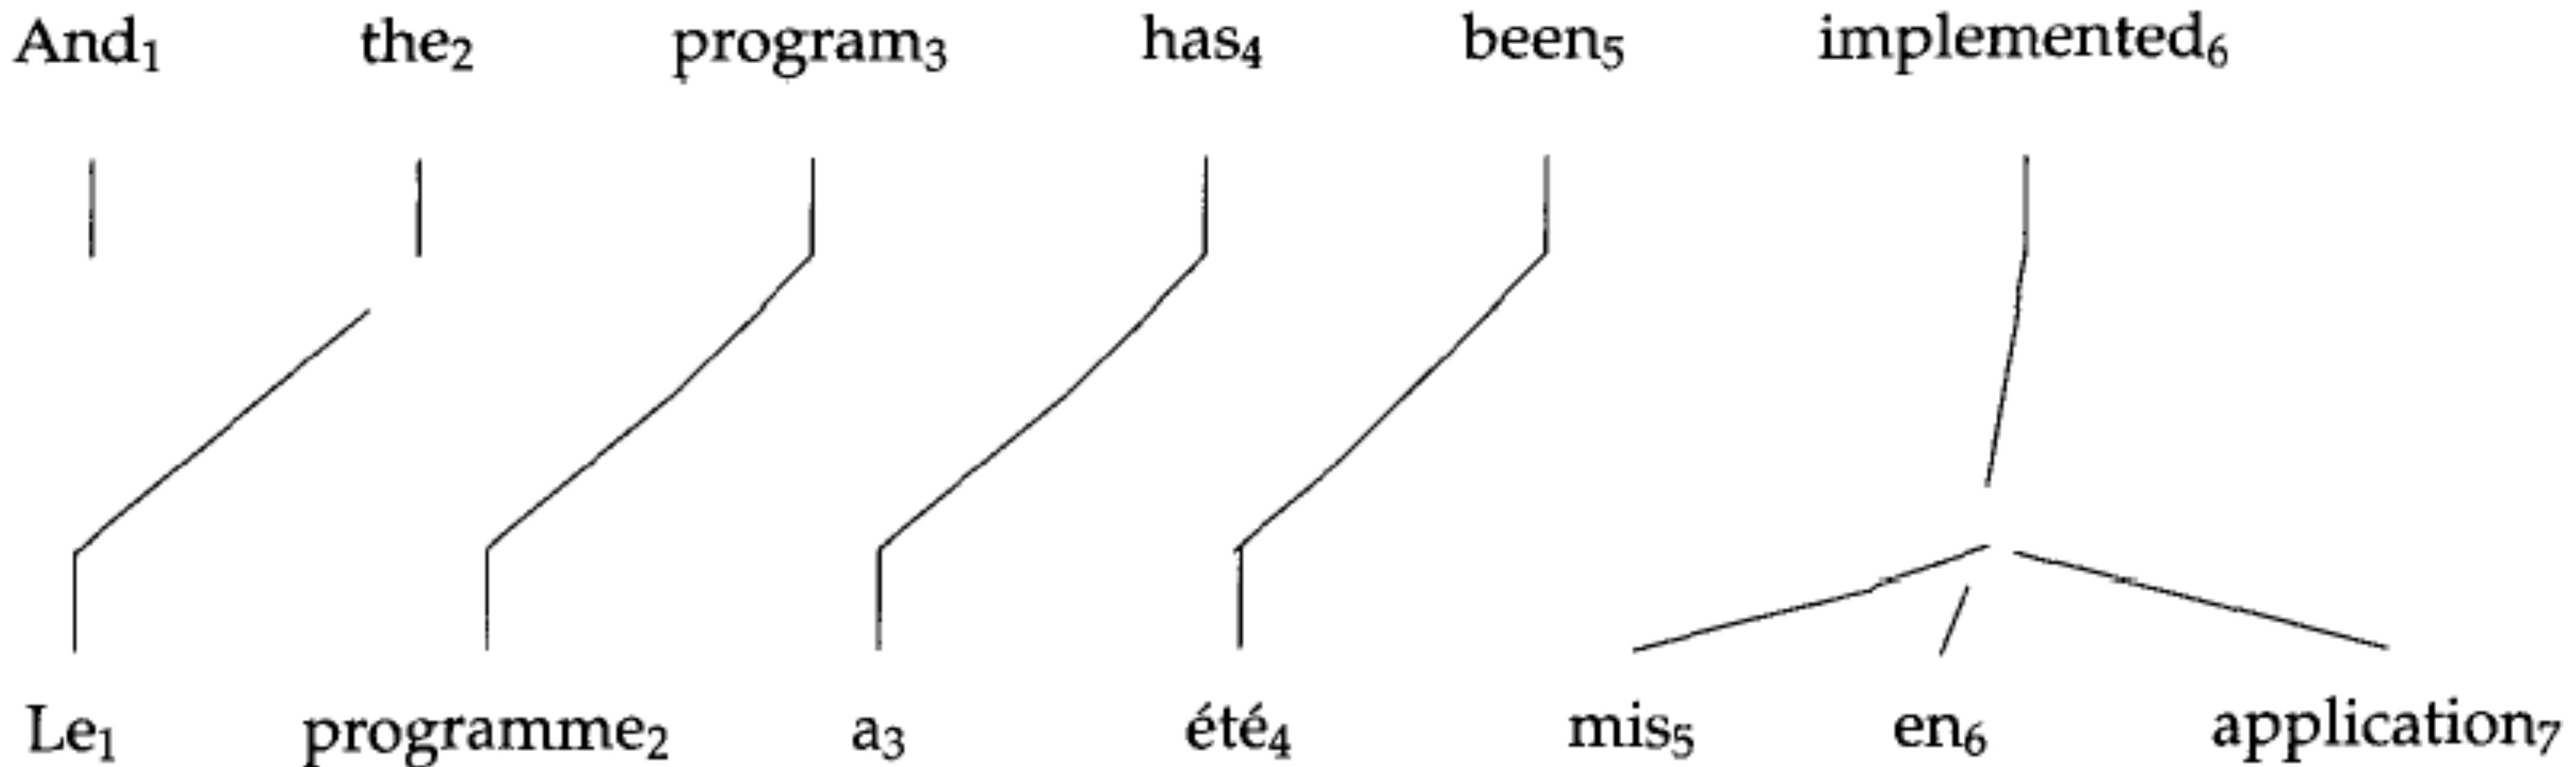

- ▶ Output: alignments between words in each sentence

- ▶ We will see how to turn these into phrases

“accept and acceptons are aligned”

1-to-Many Alignments

- ▶ An alignment a identifies which English word each French word originated from.

Word Alignment

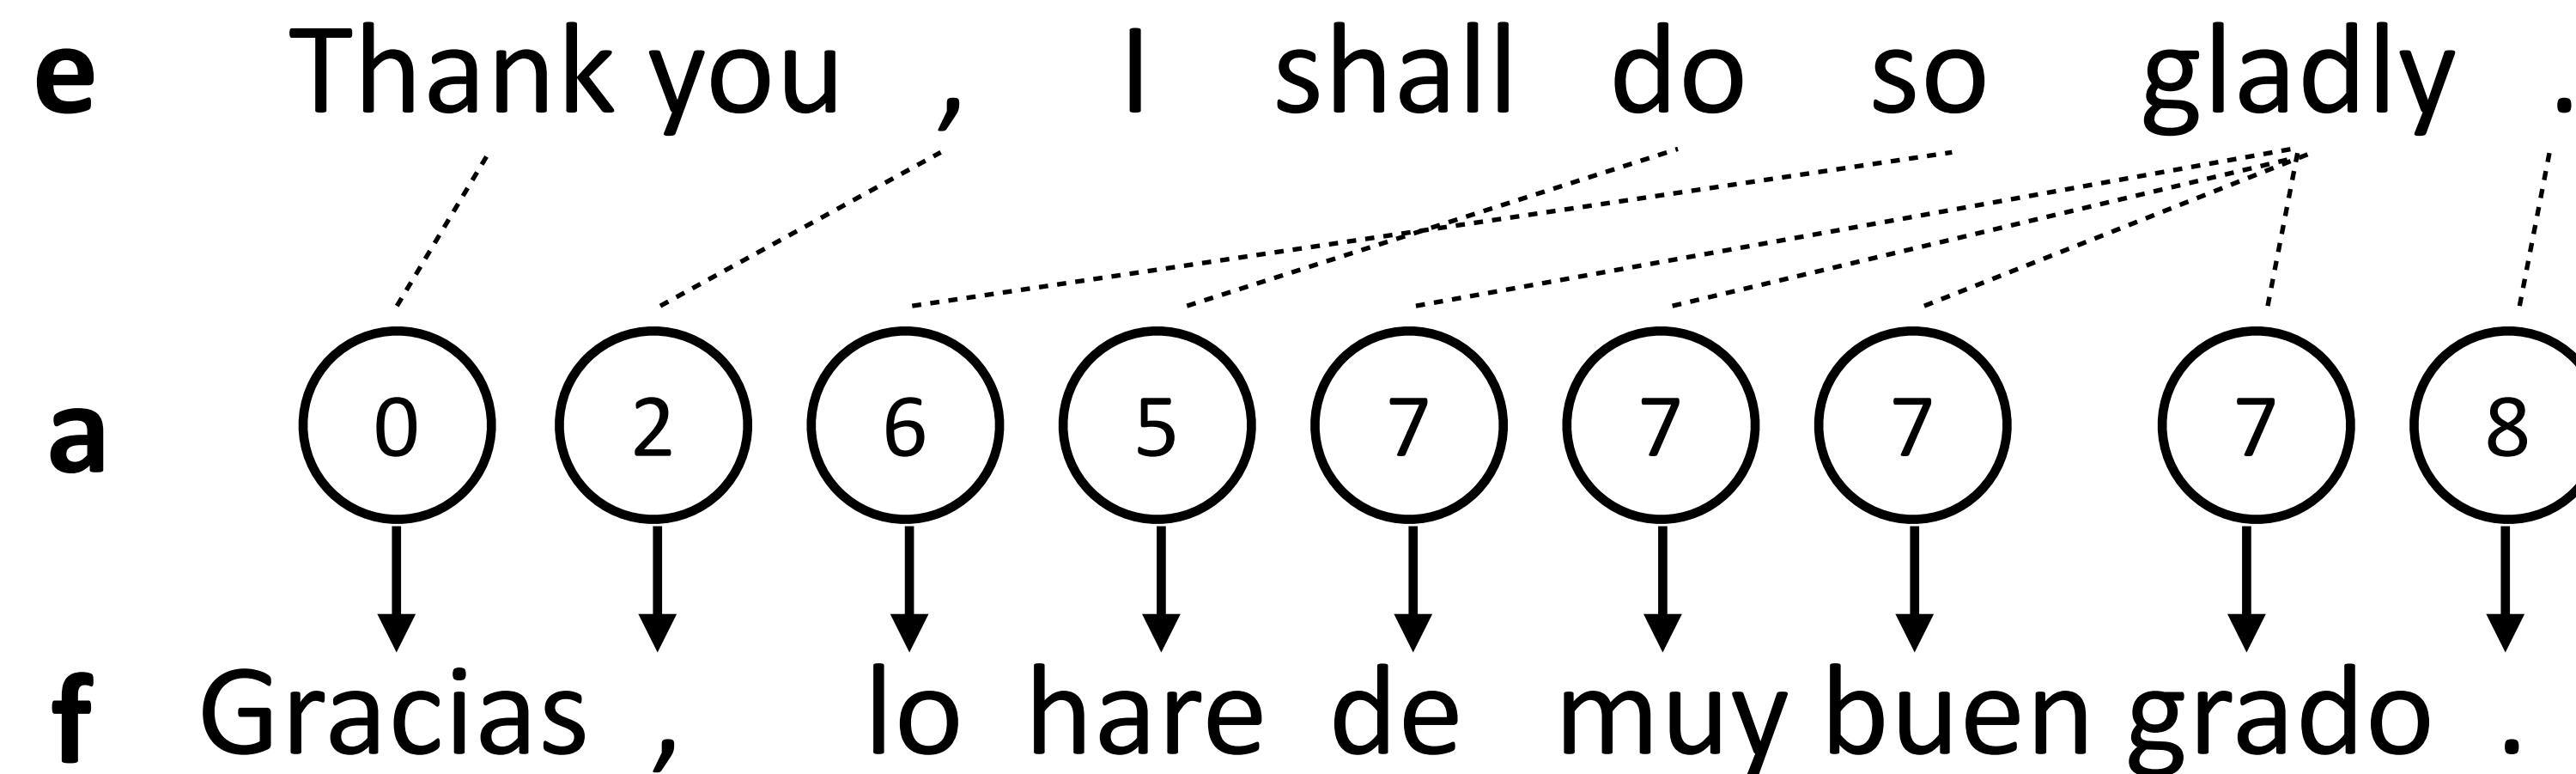

- ▶ Models $P(f|e)$: probability of “Foreign” sentence being generated from “English” sentence according to a model
- ▶ Latent variable model:
$$P(f|e) = \sum_a P(f, a|e) = \sum_a P(f|a, e)P(a)$$

↑
sum over all possible alignments
- ▶ Correct alignments should lead to higher-likelihood generations, so by optimizing this objective we will learn correct alignments
 - ▶ using expectation-maximization (EM) algorithm (Eisenstein ch 18.2.2)

IBM Model 1

- ▶ Each “Foreign” word is aligned to *at most* one English word

$$P(\mathbf{f}, \mathbf{a}|\mathbf{e}) = \prod_{i=1}^n P(f_i|e_{a_i})P(a_i)$$

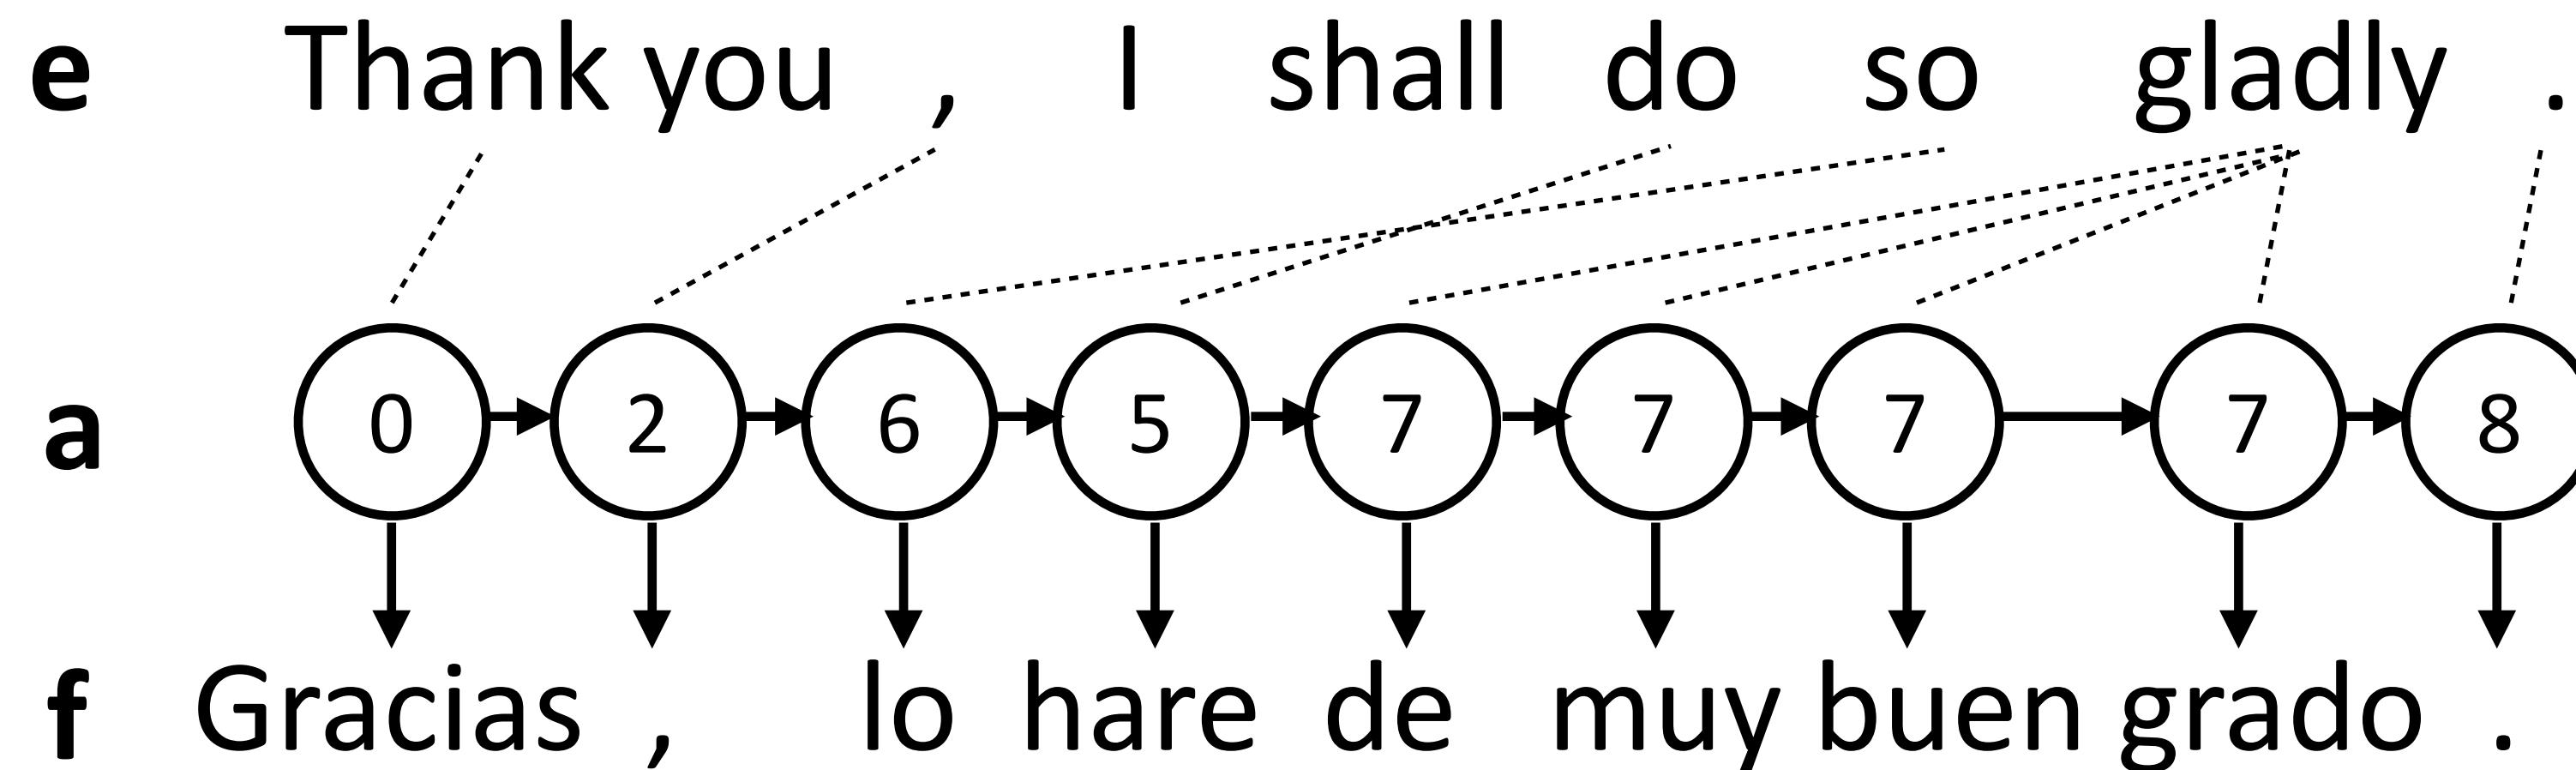

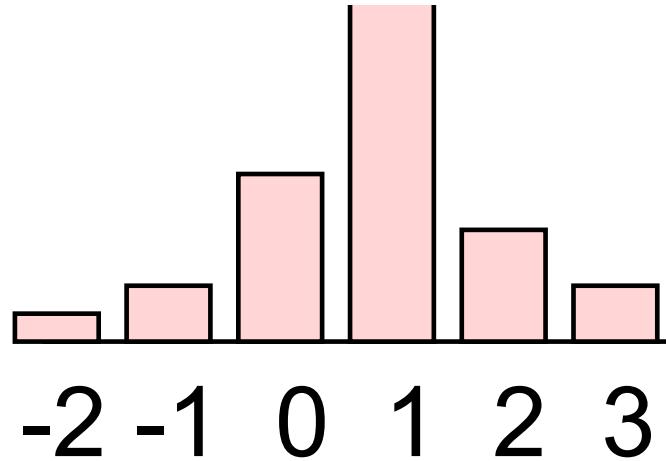

- ▶ Set $P(a)$ uniformly (no prior over good alignments)
- ▶ $P(f_i|e_{a_i})$: word translation probability table. Learn with EM

HMM for Alignment

- ▶ Sequential dependence between a's to capture monotonicity

$$P(\mathbf{f}, \mathbf{a} | \mathbf{e}) = \prod_{i=1}^n P(f_i | e_{a_i}) P(a_i | a_{i-1})$$

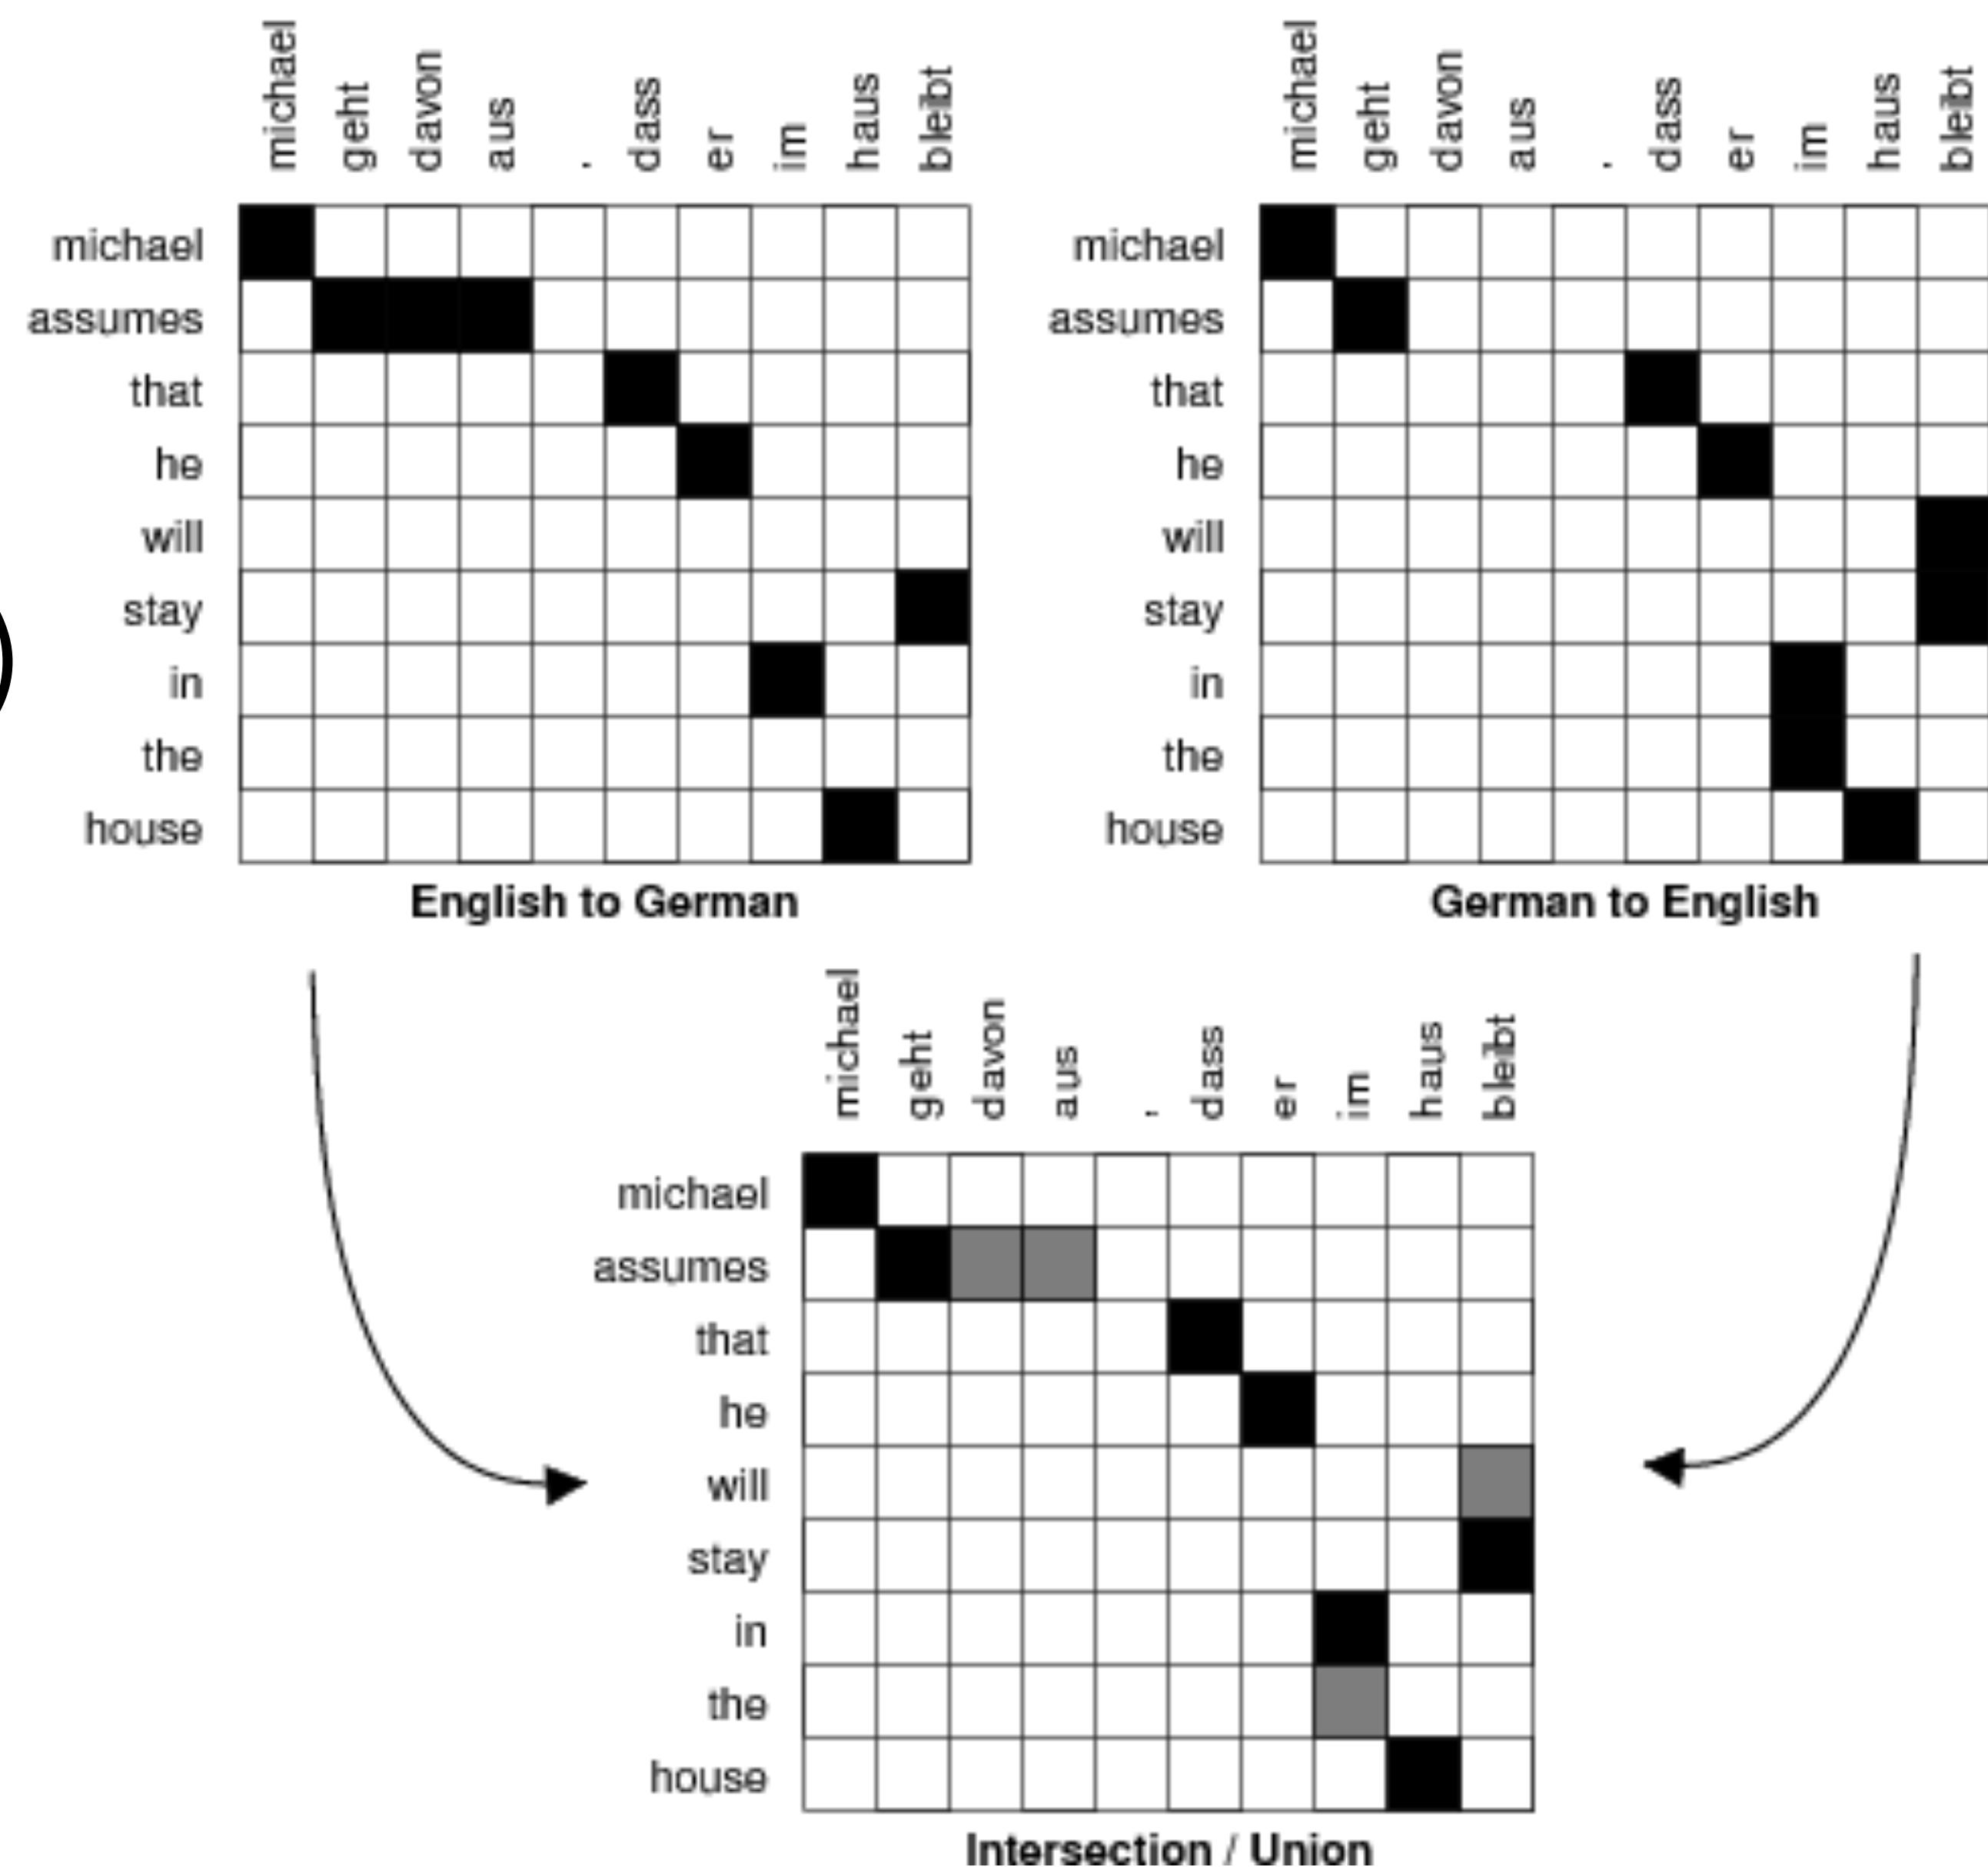

- ▶ Alignment dist parameterized by jump size: $P(a_j - a_{j-1})$ → 
- ▶ $P(f_i | e_{a_i})$: same as before

Brown et al. (1993)

HMM Model

- ▶ Run in both directions
 - ▶ Alignments are generally monotonic (along diagonal)
 - ▶ Some mistakes, especially when you have rare words (*garbage collection*)

Phrase Extraction

- ▶ Find contiguous sets of aligned words in the two languages that don't have alignments to other words

d'assister à la reunion et ||| to attend the meeting and

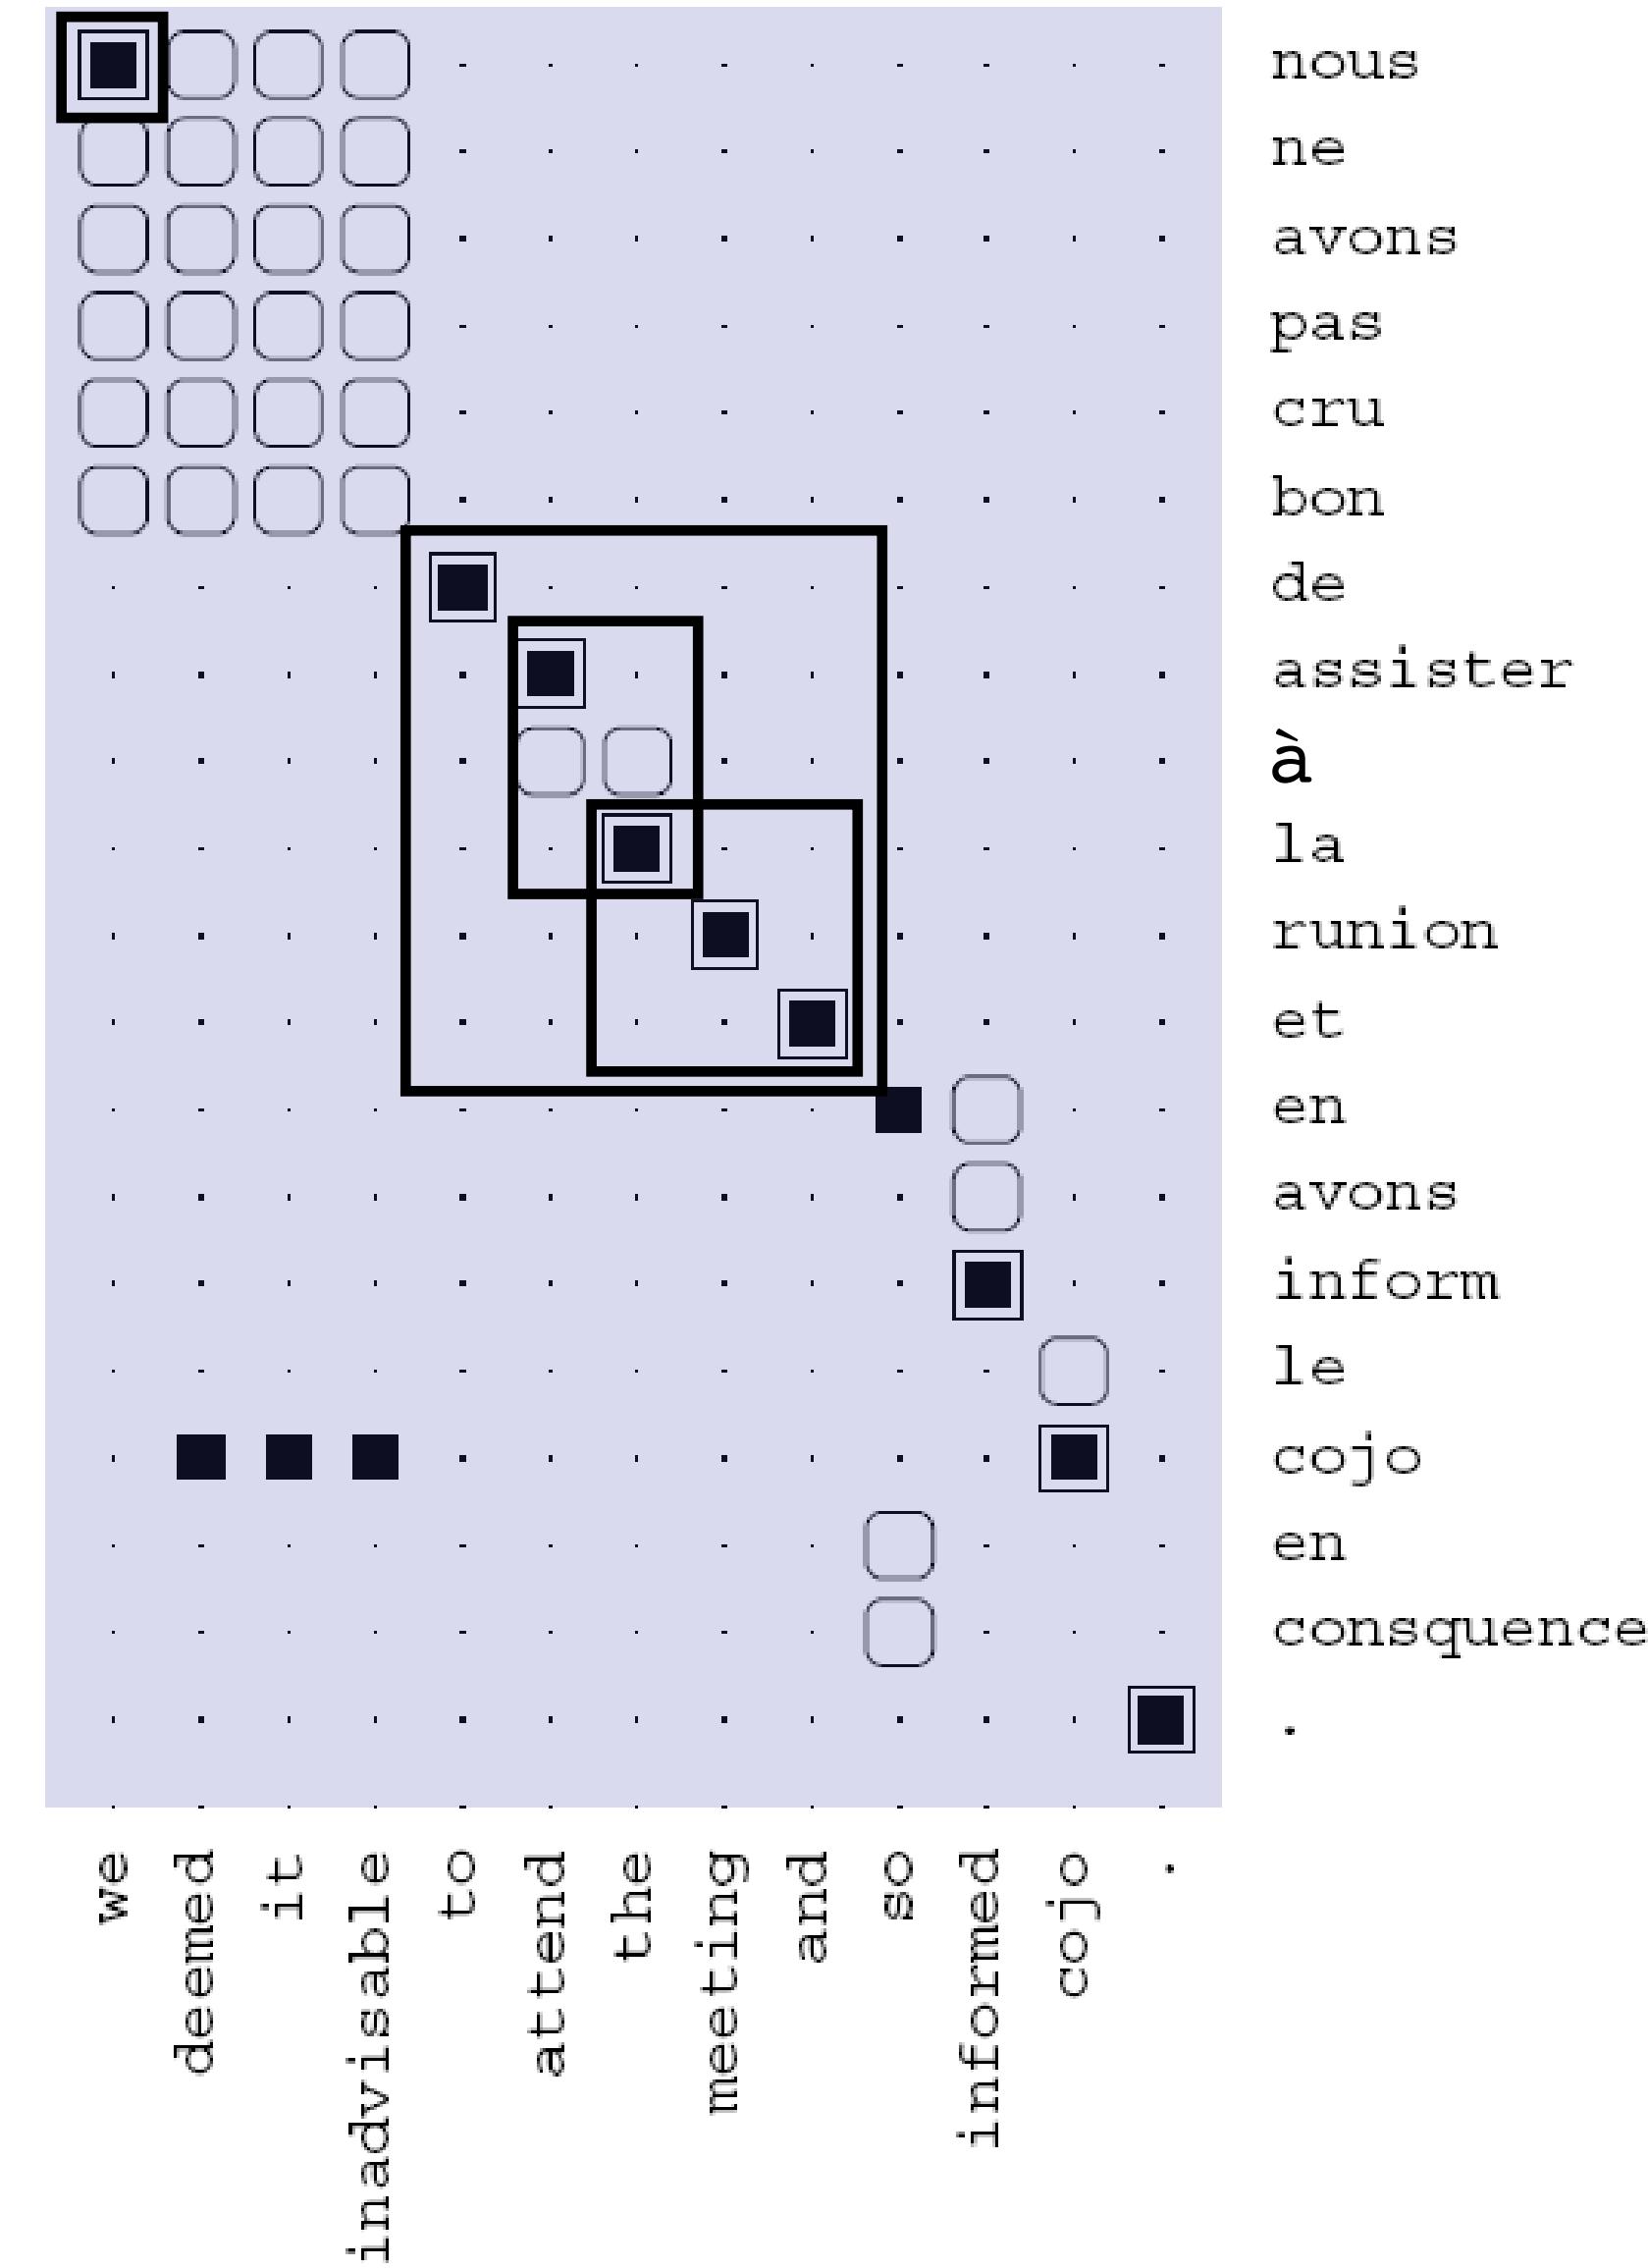

assister à la reunion ||| attend the meeting

la reunion and ||| the meeting and

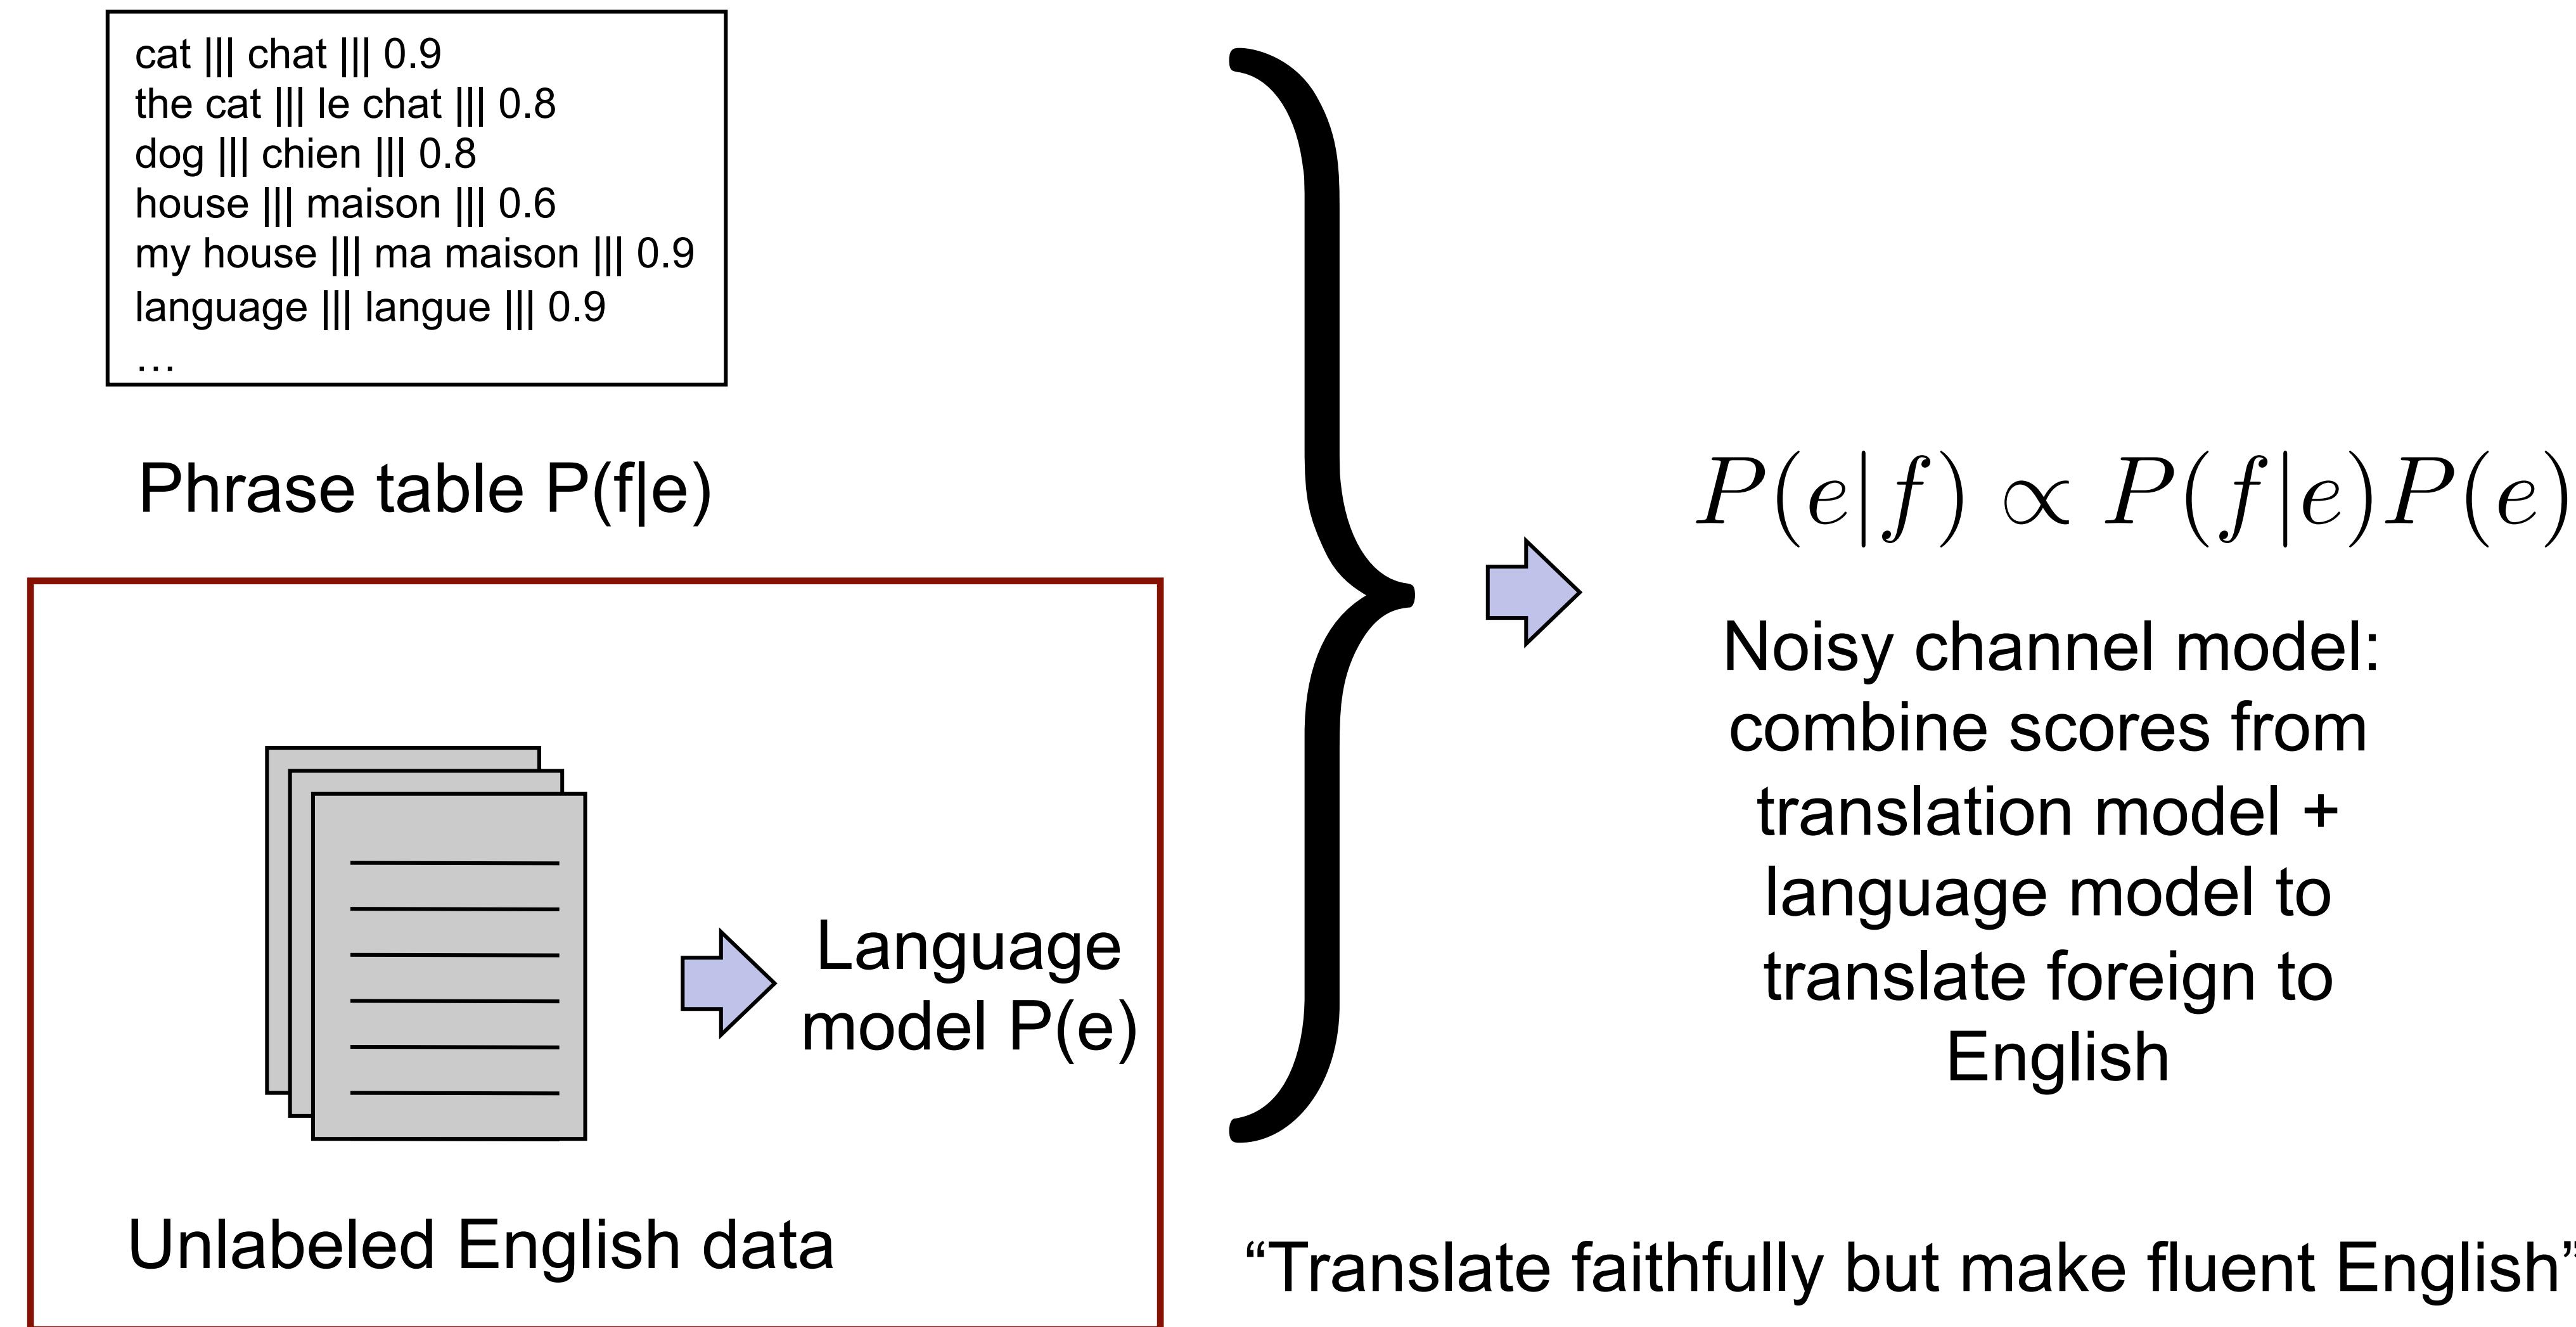

nous ||| we

...

- ▶ Lots of phrases possible, count across all sentences and score by frequency

Phrase-Based MT

Language Modeling

N-gram Language Models

I visited San _____ put a distribution over the next word

- ▶ Simple generative model: distribution of next word is a multinomial distribution conditioned on previous n-1 words

$$P(x|\text{visited San}) = \frac{\text{count}(\text{visited San}, x)}{\text{count}(\text{visited San})}$$

Maximum likelihood estimate of this probability from a corpus

- ▶ Just relies on counts, even in 2008 could scale up to 1.3M word types, 4B n-grams (all 5-grams occurring >40 times on the Web)

Smoothing N-gram Language Models

I visited San _____ put a distribution over the next word!

- ▶ Smoothing is very important, particularly when using 4+ gram models

$$P(x|\text{visited San}) = (1 - \lambda) \frac{\text{count}(\text{visited San}, x)}{\text{count}(\text{visited San})} + \lambda \frac{\text{count}(\text{San}, x)}{\text{count}(\text{San})}$$

smooth
this
too!

- ▶ One technique is “absolute discounting:” subtract off constant k from numerator, set lambda to make this normalize ($k=1$ is like leave-one-out)

$$P(x|\text{visited San}) = \frac{\text{count}(\text{visited San}, x) - k}{\text{count}(\text{visited San})} + \lambda \frac{\text{count}(\text{San}, x)}{\text{count}(\text{San})}$$

- ▶ Kneser-Ney smoothing: this trick, plus low-order distributions modified to capture fertilities (how many distinct words appear in a context)

Engineering N-gram Models

- ▶ For 5+-gram models, need to store between 100M and 10B context-word-count triples

(a) Context-Encoding

w	c	val
1933	15176585	3
1933	15176587	2
1933	15176593	1
1933	15176613	8
1933	15179801	1
1935	15176585	298
1935	15176589	1

(b) Context Deltas

Δw	Δc	val
1933	15176585	3
+0	+2	1
+0	+5	1
+0	+40	8
+0	+188	1
+2	15176585	298
+0	+4	1

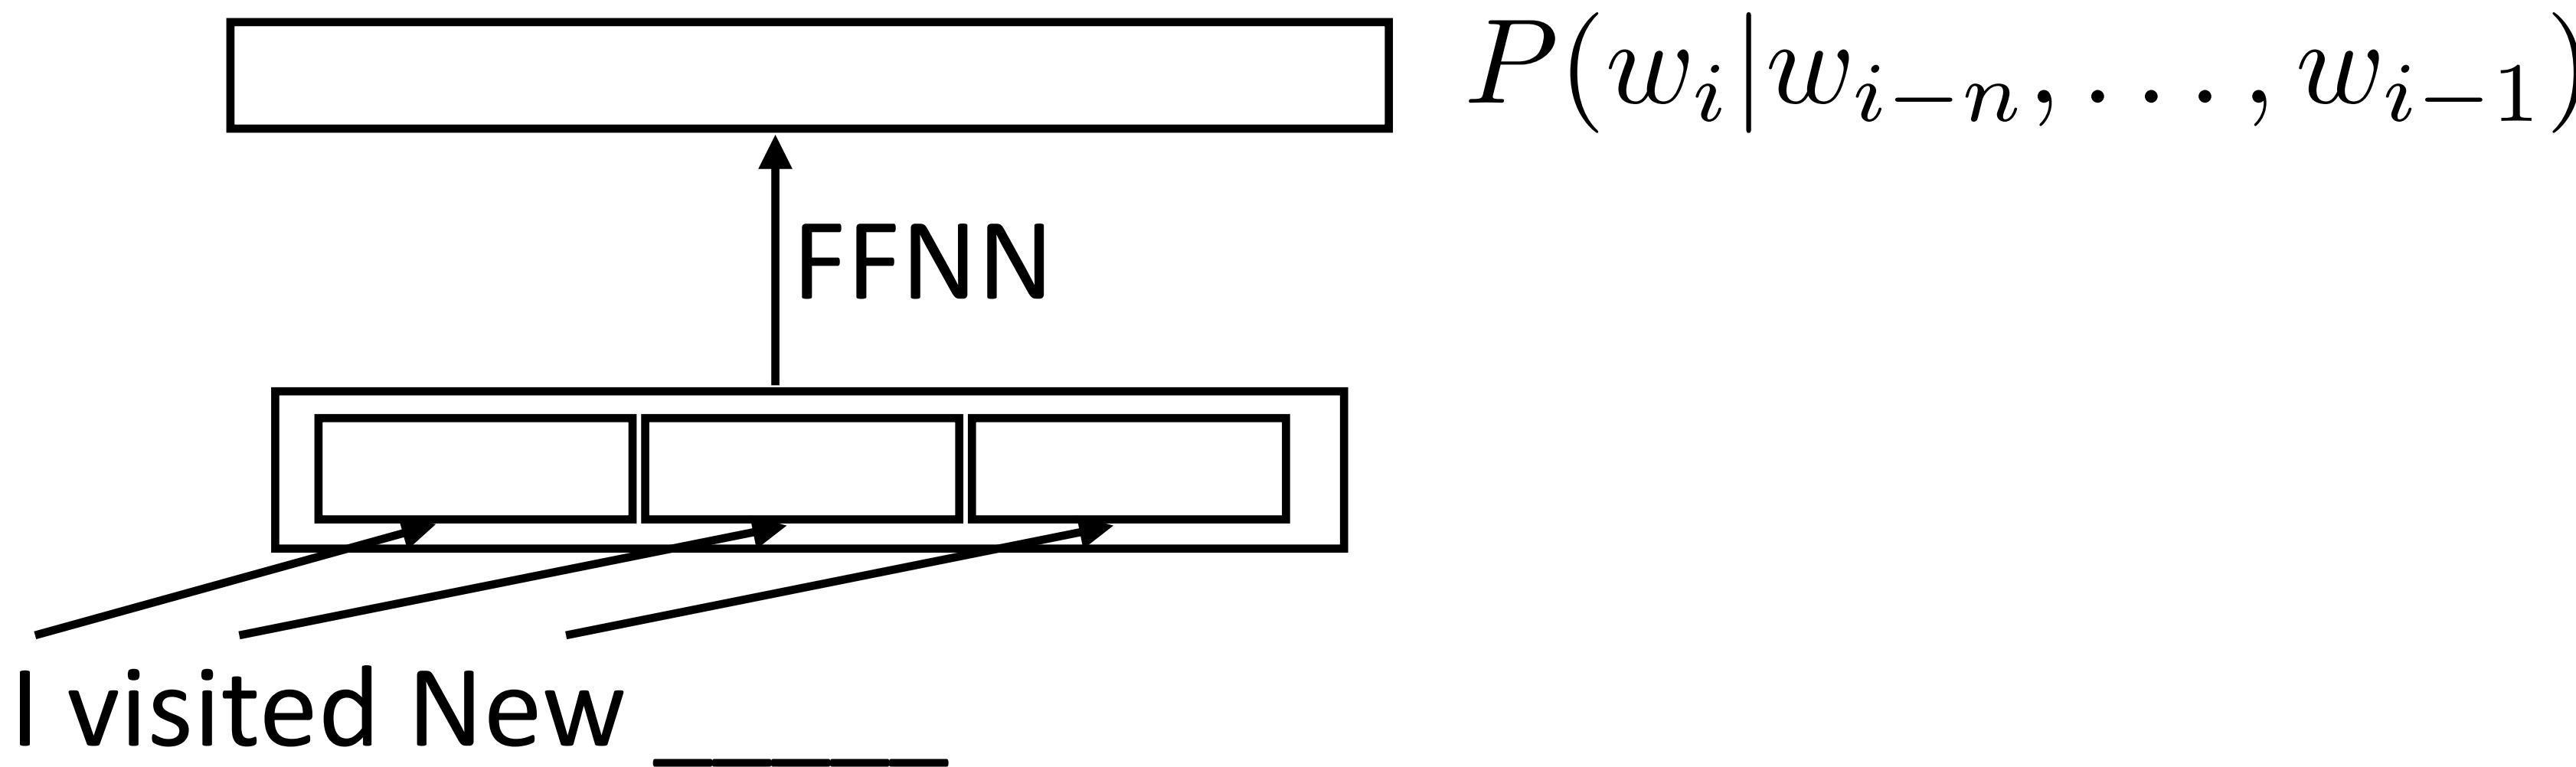

(c) Bits Required

$ \Delta w $	$ \Delta c $	$ val $
24	40	3
2	3	3
2	3	3
2	9	6
2	12	3
4	36	15
2	6	3

- ▶ Make it fit in memory by *delta encoding* scheme: store deltas instead of values and use variable-length encoding

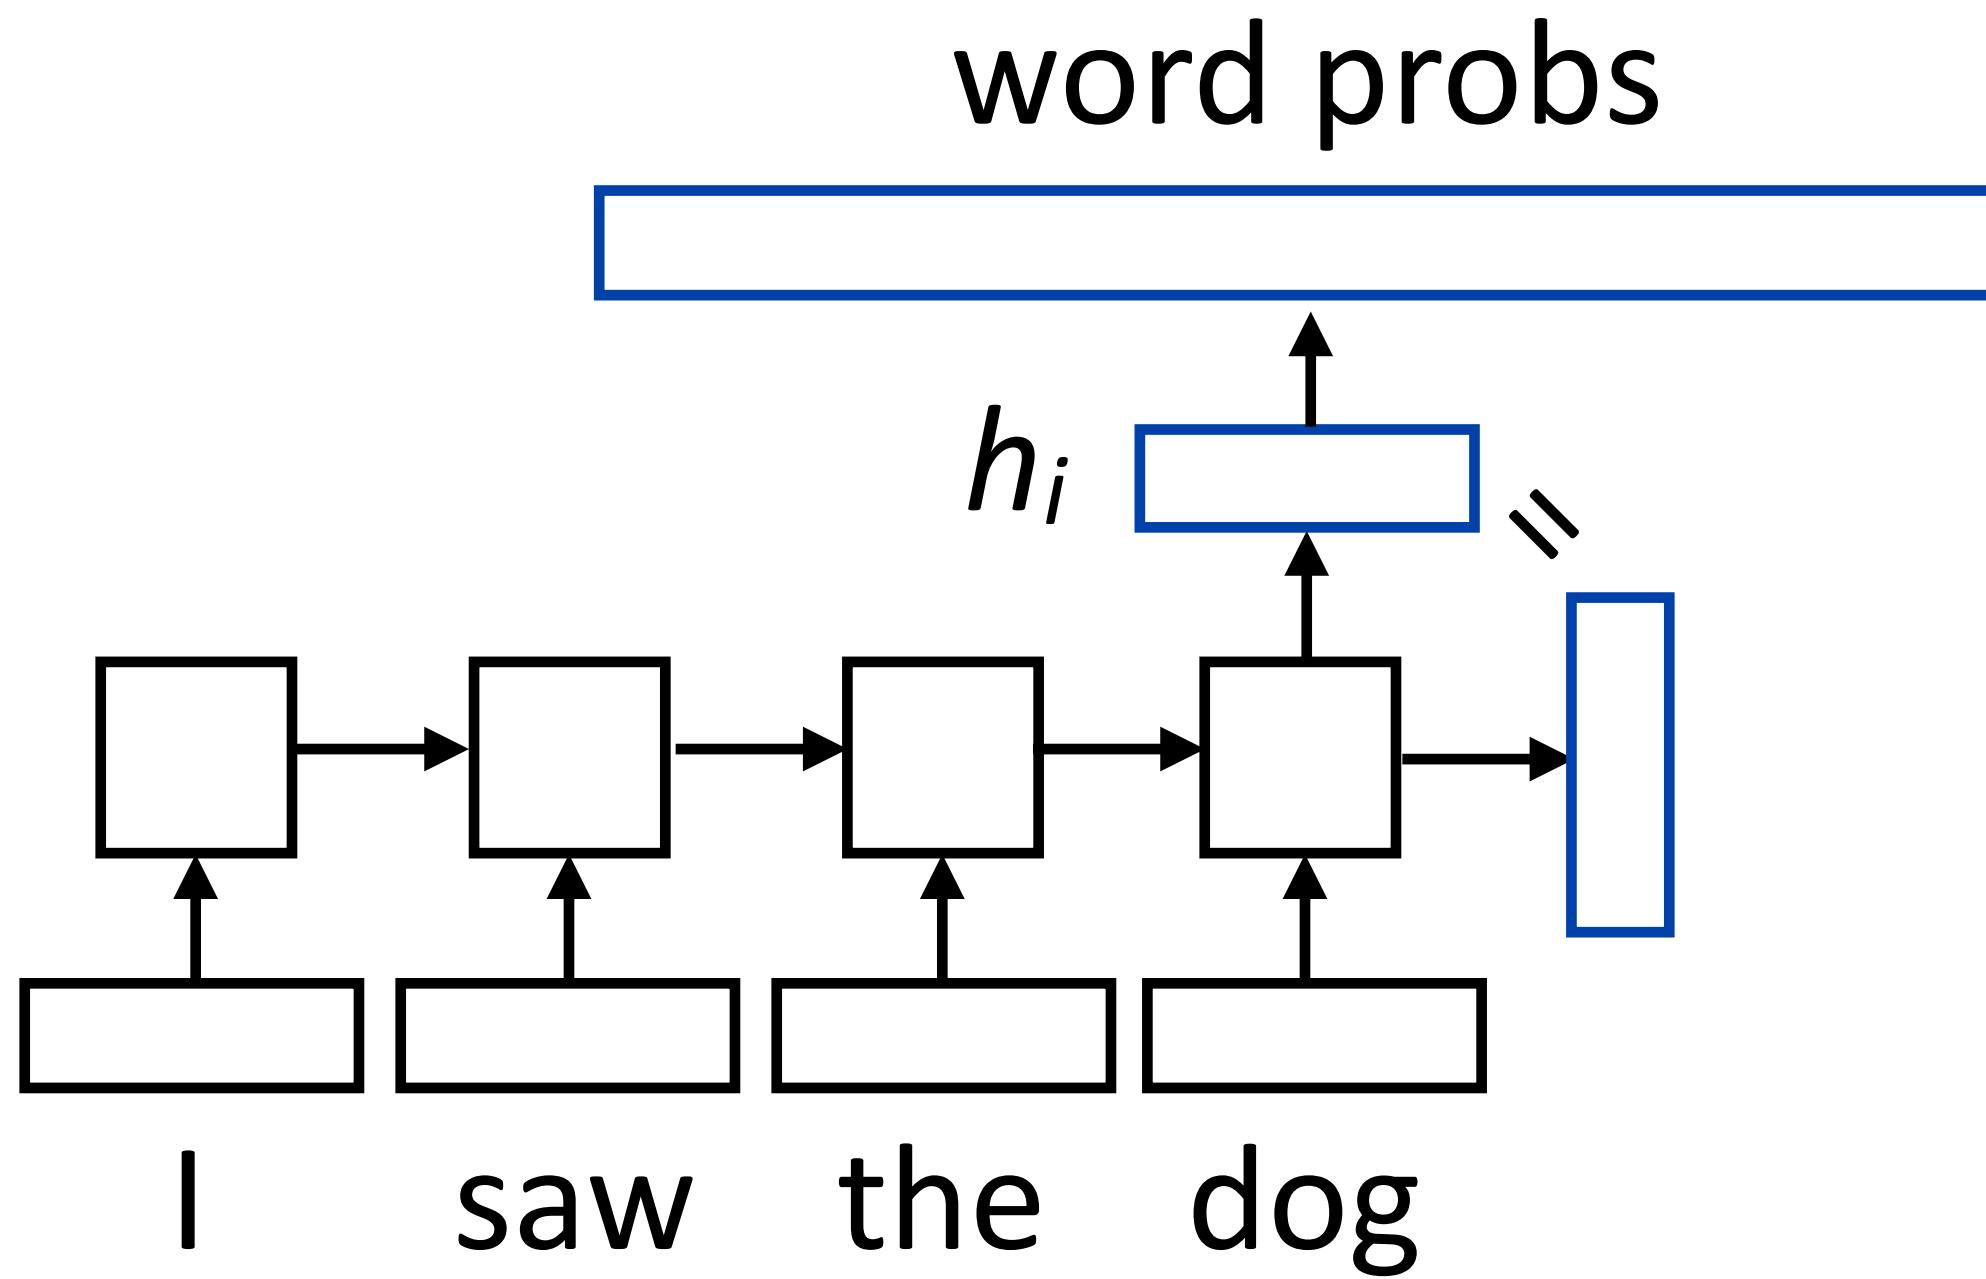

Neural Language Models

- ▶ Early work: feedforward neural networks looking at context

- ▶ Slow to train over lots of data!
- ▶ Still only look at a fixed window of context ... can we use more?

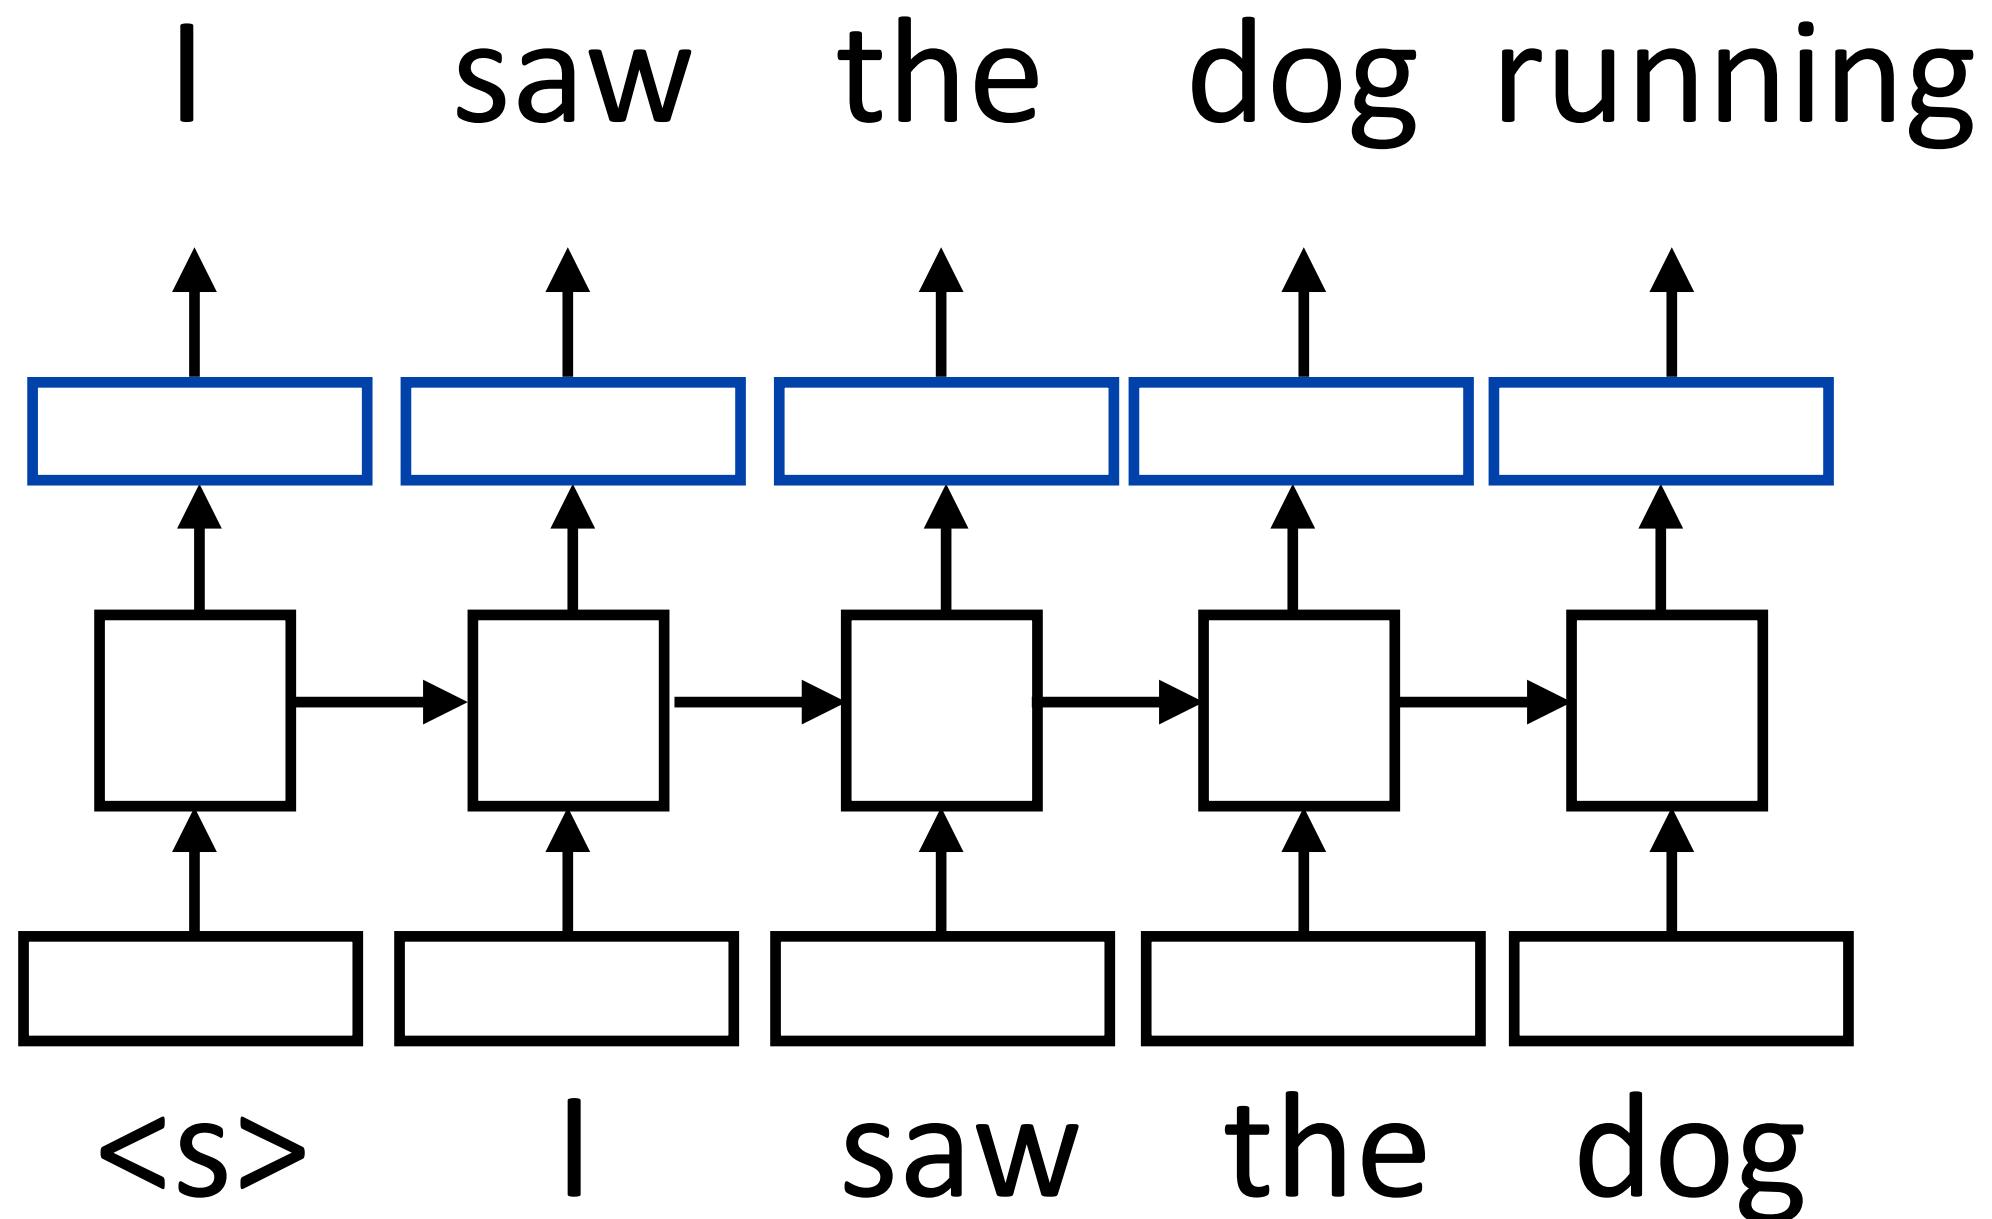

RNN Language Modeling

$$P(w|\text{context}) = \text{softmax}(W\mathbf{h}_i)$$

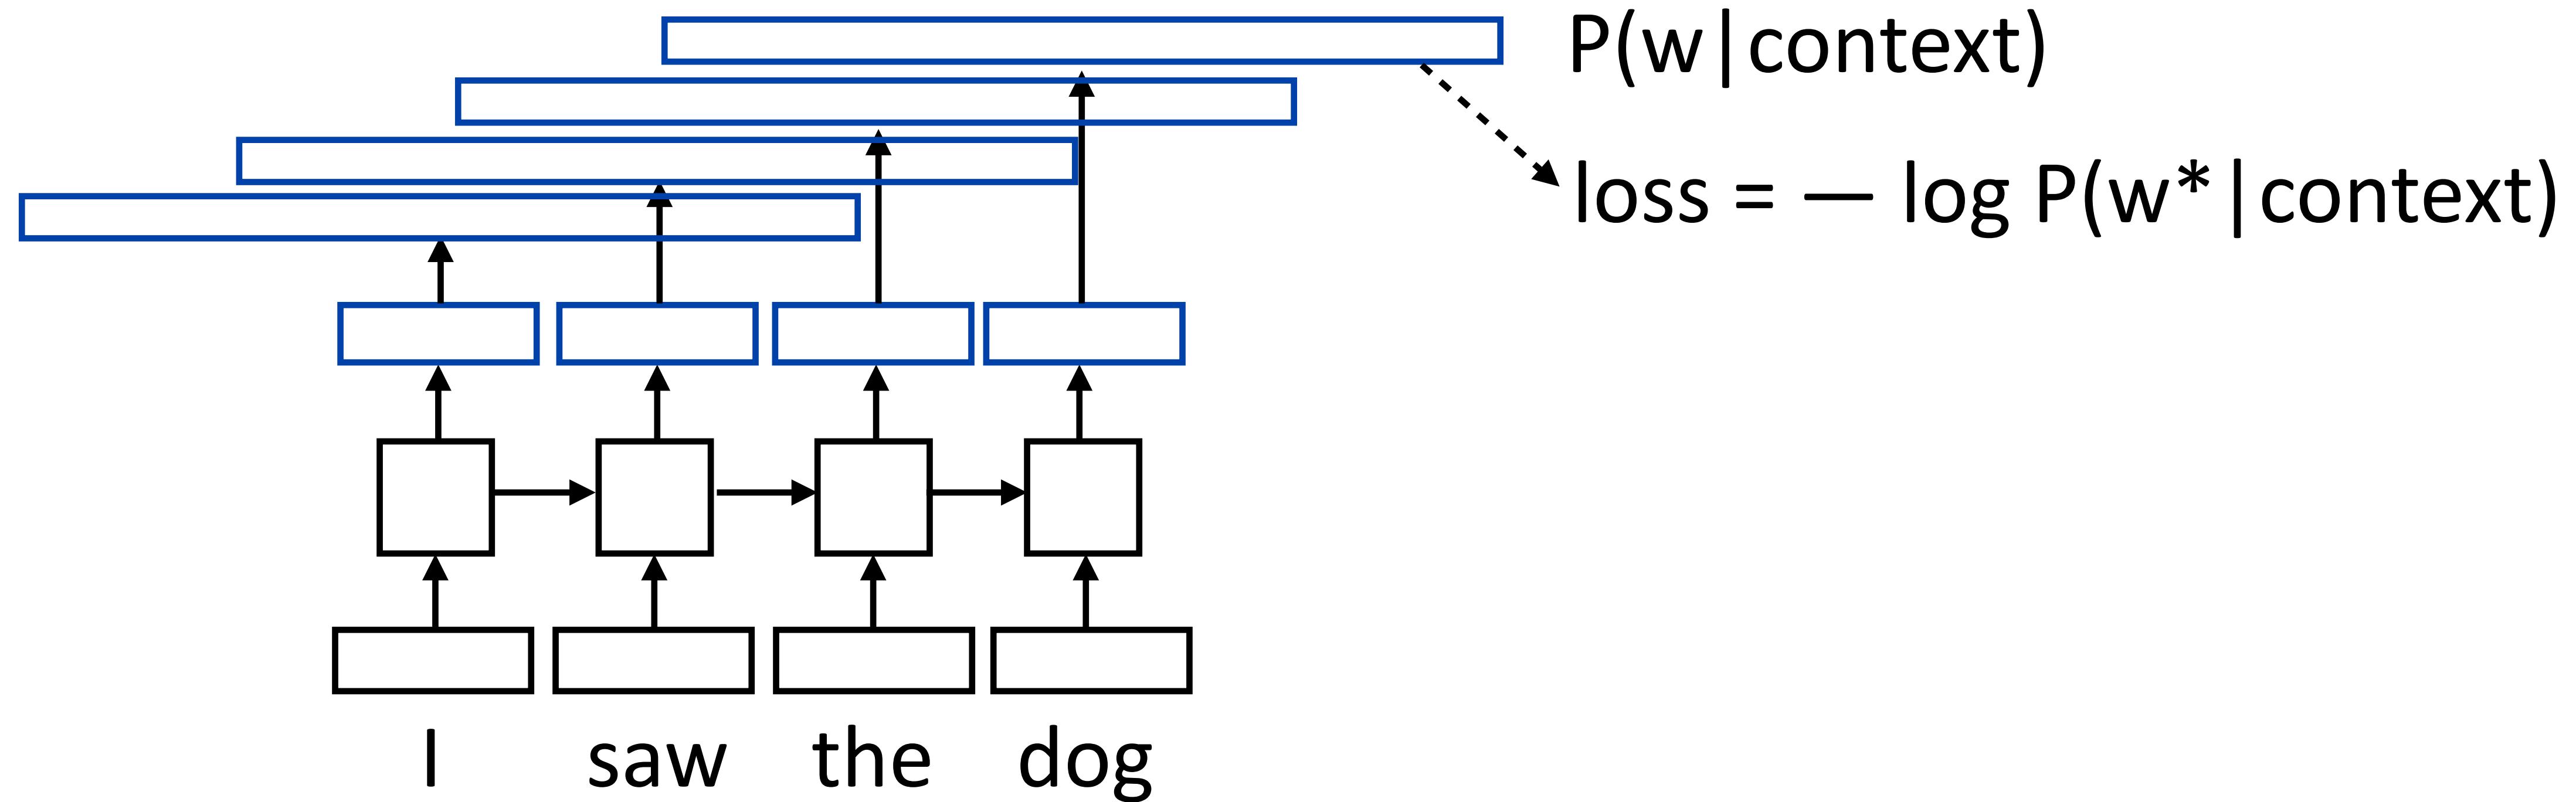

► W is a (vocab size) x (hidden size) matrix

Training RNNLMs

- ▶ Input is a sequence of words, output is those words shifted by one,
- ▶ Allows us to efficiently batch up training across time (one run of the RNN)

Training RNNLMs

- ▶ Total loss = sum of negative log likelihoods at each position
- ▶ Backpropagate through the network to simultaneously learn to predict next word given previous words at all positions

LM Evaluation

- ▶ Accuracy doesn't make sense – predicting the next word is generally impossible so accuracy values would be very low
- ▶ Evaluate LMs on the likelihood of held-out data (averaged to normalize for length)

$$\frac{1}{n} \sum_{i=1}^n \log P(w_i | w_1, \dots, w_{i-1})$$

- ▶ Perplexity: $\exp(\text{average negative log likelihood})$. Lower is better
 - ▶ Suppose we have probs 1/4, 1/3, 1/4, 1/3 for 4 predictions
 - ▶ Avg NLL (base e) = 1.242 Perplexity = 3.464

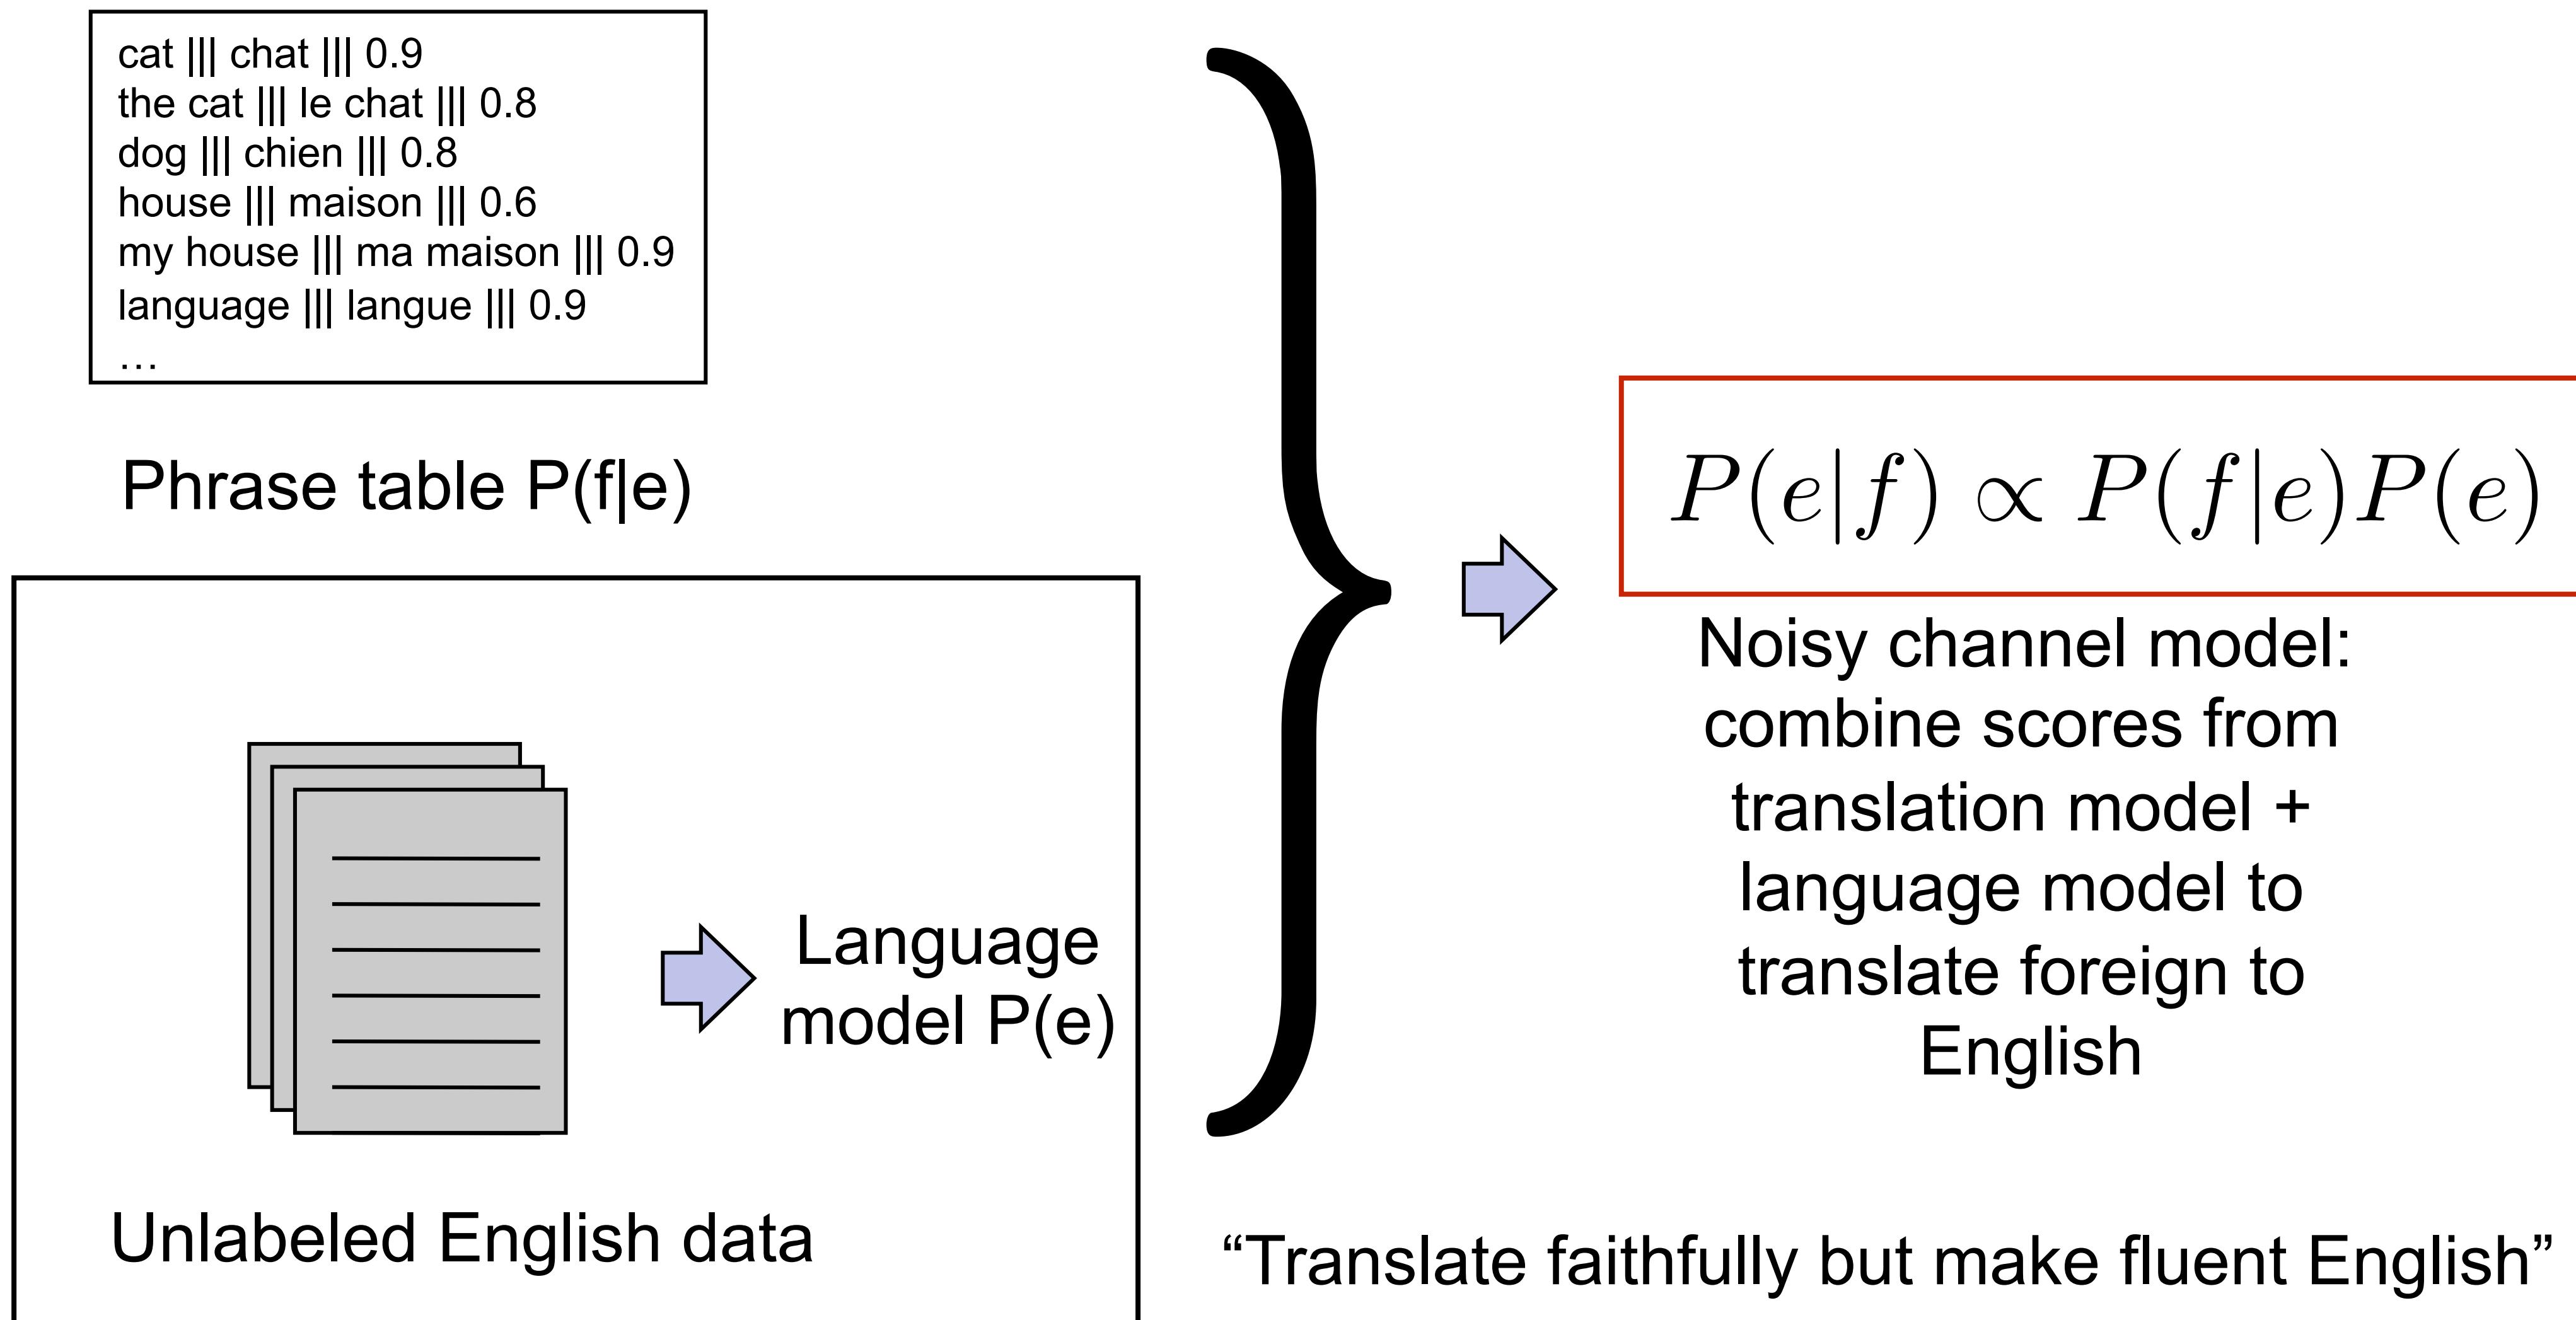

Results

- ▶ Evaluate on Penn Treebank: small dataset (1M words) compared to what's used in MT, but common benchmark
- ▶ Kneser-Ney 5-gram model with cache: PPL = 125.7
- ▶ LSTM: PPL ~ 60-80 (depending on how much you optimize it)
- ▶ Melis et al.: many neural LM improvements from 2014-2017 are subsumed by just using the right regularization (right dropout settings). So LSTMs are pretty good

Applications of Language Modeling

- ▶ Not limited to machine translations!
- ▶ All generation tasks: dialogue, text simplification, paraphrasing, story generation, etc.
- ▶ Grammatical error correction
- ▶ Pretraining! (more later in the course)
 - ▶ Language modeling involves predicting words given context.
 - ▶ Learning a neural network to do this induces useful representations for other tasks, similar to word2vec/GloVe.
 - ▶ ELMo, BERT, RoBERTa, GPT-2, GPT-3 ...

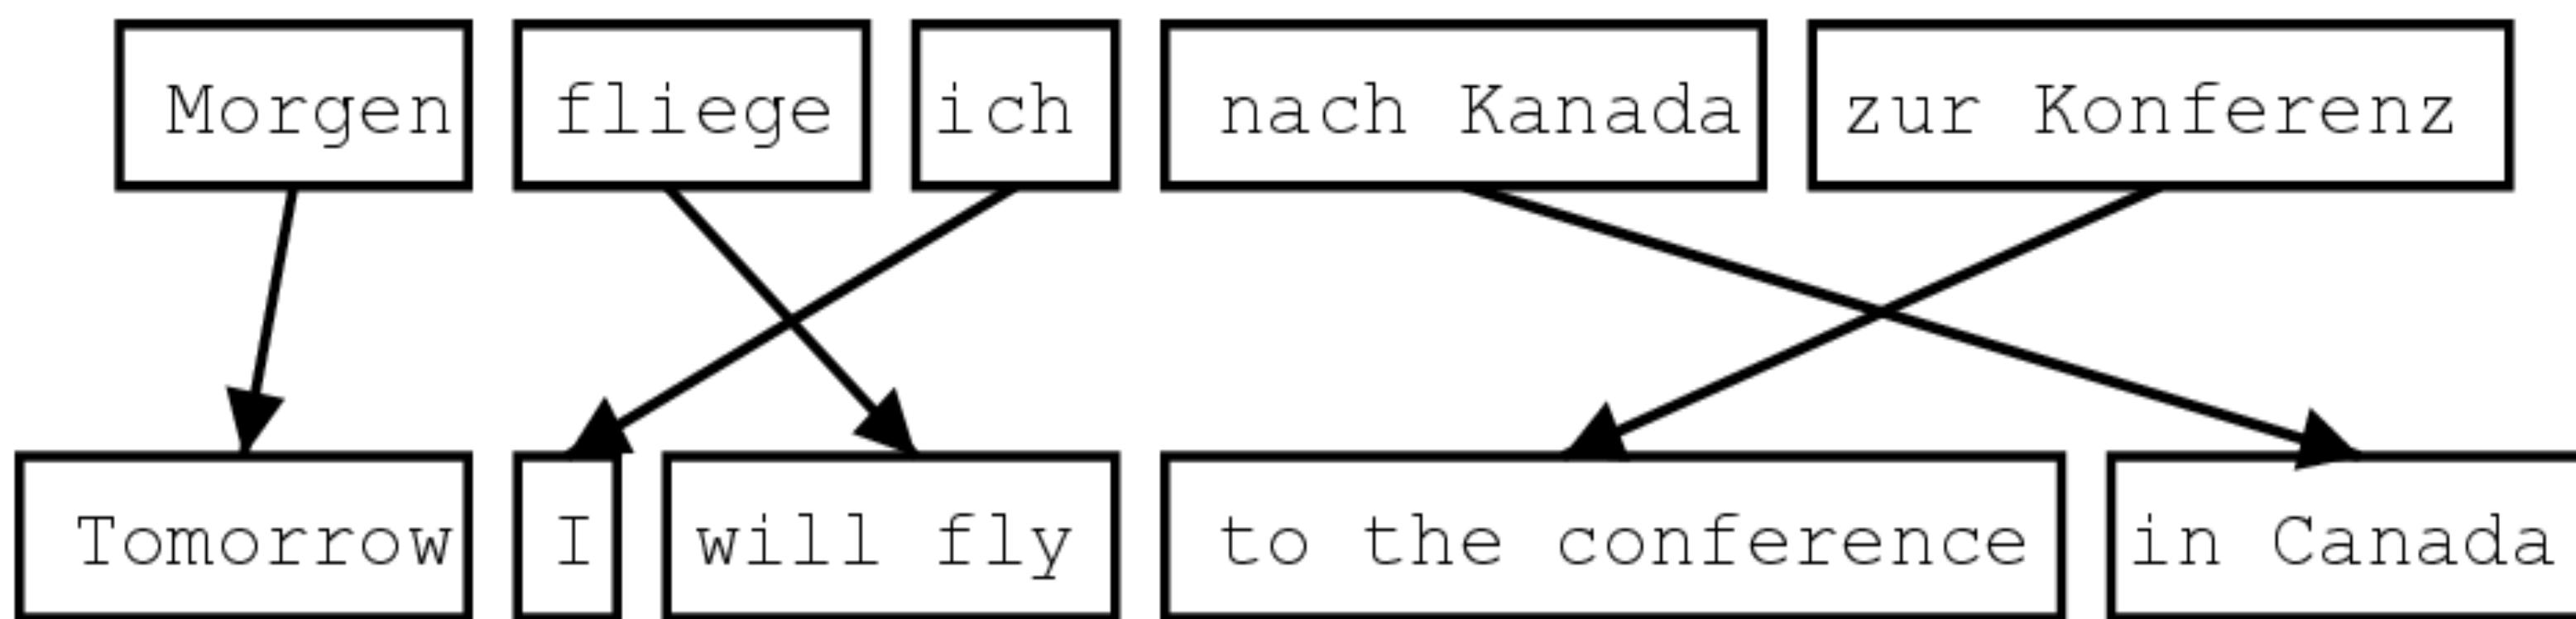

Phrase-Based MT

Decoding

Phrase-Based Decoding

- ▶ Inputs:
 - ▶ Language model that scores $P(e_i|e_1, \dots, e_{i-1}) \approx P(e_i|e_{i-n-1}, \dots, e_{i-1})$
 - ▶ Phrase table: set of phrase pairs (e, f) with probabilities $P(f|e)$
- ▶ What we want to find: e produced by a series of phrase-by-phrase translations from an input f , possibly with reordering:

Phrase lattices are big!

这 7人 中包括 来自 法国 和 俄罗斯 的 宇航 员 .

the	7 people	including	by some	and	the russian	the	the astronauts	,
it	7 people included	by france		and the	the russian		international astronautical	of rapporteur .
this	7 out	including the	from	the french	and the russian	the fifth		.
these	7 among	including from		the french and	of the russian	of	space	members .
that	7 persons	including from the		of france	and to	russian	of the	aerospace members .
	7 include	from the	of france and		russian		astronauts	. the
	7 numbers include	from france		and russian		of astronauts who		."
	7 populations include	those from france		and russian		astronauts .		
	7 deportees included	come from	france	and russia	in	astronautical	personnel	;
7 philtrum	including those from		france and	russia	a space		member

				and russia 's			special rapporteur	
				, and russia			rapporteur	
				, and russia			rapporteur .	
				, and russia				
				or	russia 's			

Phrase-Based Decoding

- ▶ Input

lo haré | rápidamente | .

- ▶ Translations

I'll do it | quickly | .

quickly | I'll do it | .

The decoder...

tries different segmentations,

translates phrase by phrase,

and considers reorderings.

$$\arg \max_{\mathbf{e}} [P(\mathbf{f}|\mathbf{e}) \cdot P(\mathbf{e})]$$

- ▶ Decoding objective
(for 3-gram LM)

$$\arg \max_{\mathbf{e}} \left[\prod_{\langle \bar{e}, \bar{f} \rangle} P(\bar{f}|\bar{e}) \cdot \prod_{i=1}^{|\mathbf{e}|} P(e_i|e_{i-1}, e_{i-2}) \right]$$

Beam Search

Maria	no	dio	una	bofetada	a	la	bruja	verde
<u>Mary</u>	<u>not</u>	<u>give</u>	<u>a</u>	<u>slap</u>	<u>to</u>	<u>the</u>	<u>witch</u>	<u>green</u>
	<u>did not</u>			<u>a slap</u>	<u>by</u>		<u>green witch</u>	
	<u>no</u>		<u>slap</u>		<u>to the</u>			
	<u>did not give</u>				<u>to</u>			
				<u>slap</u>		<u>the</u>		
						<u>the witch</u>		

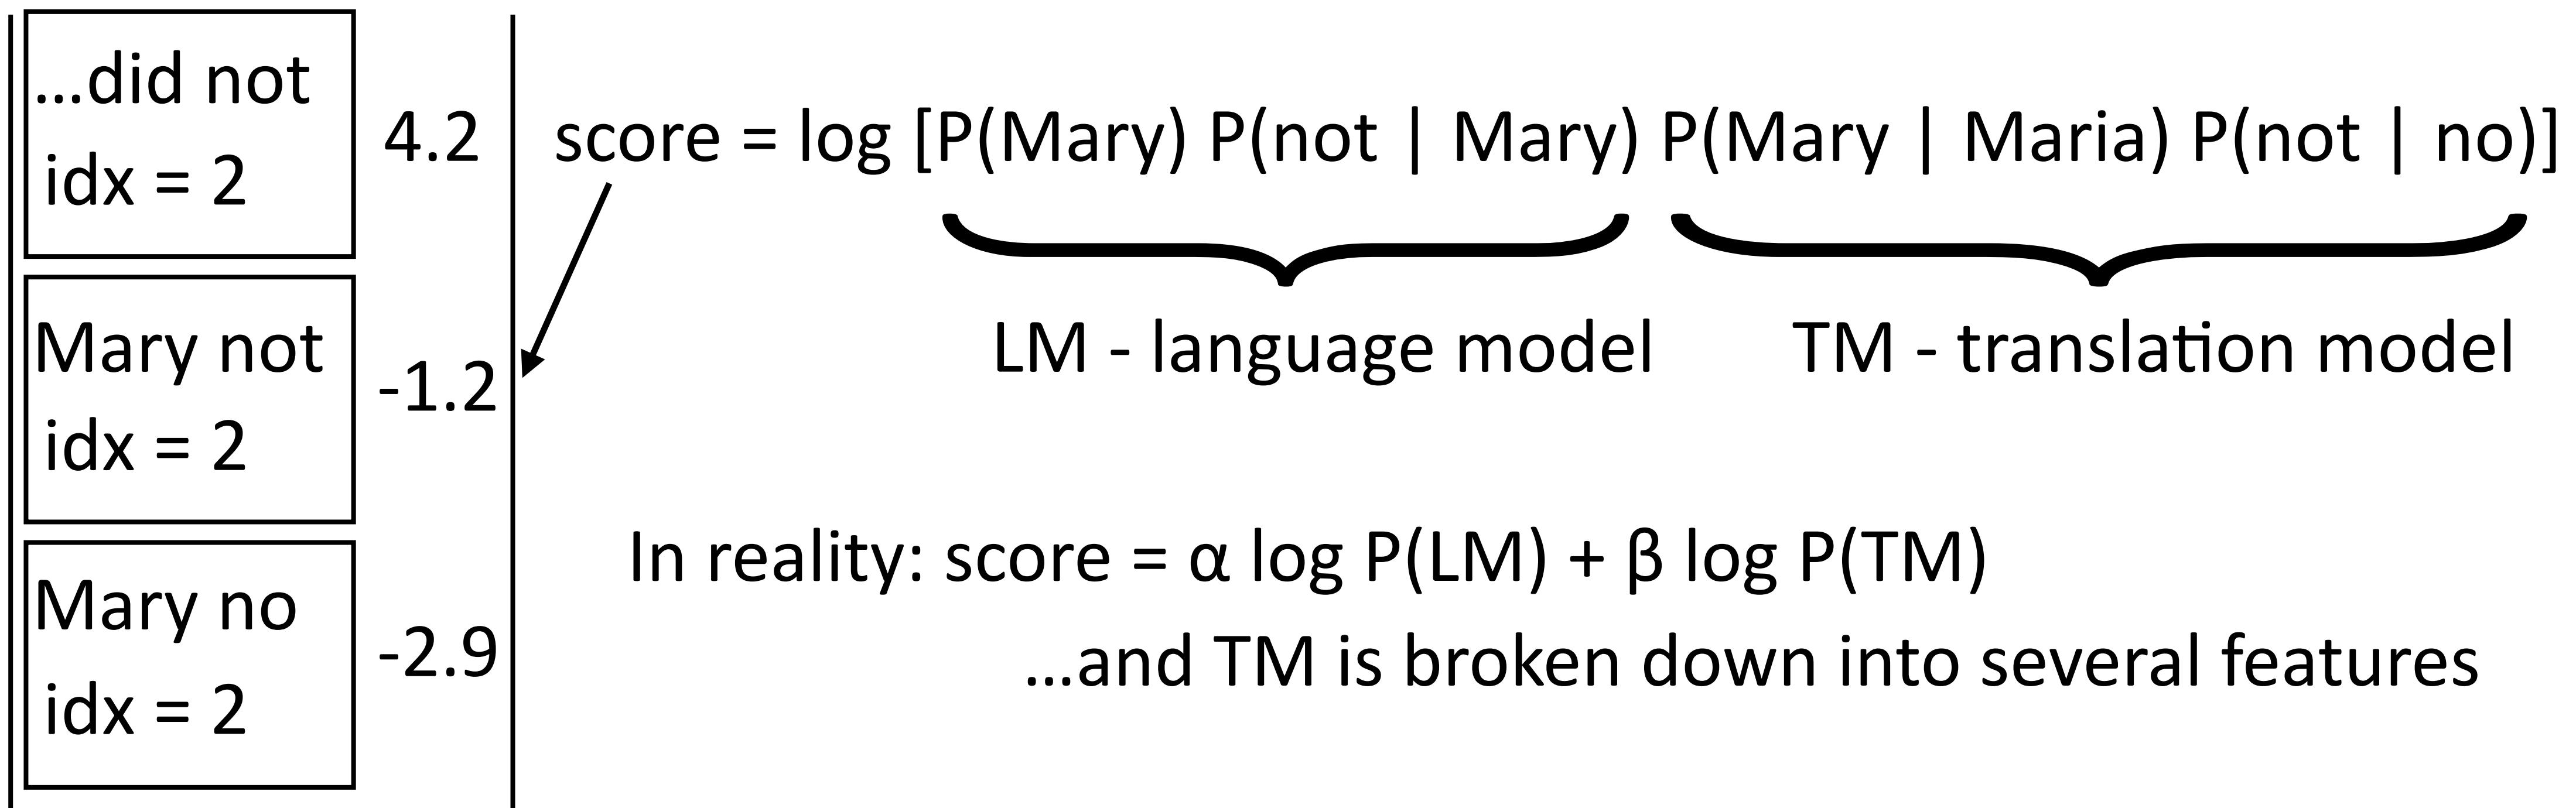

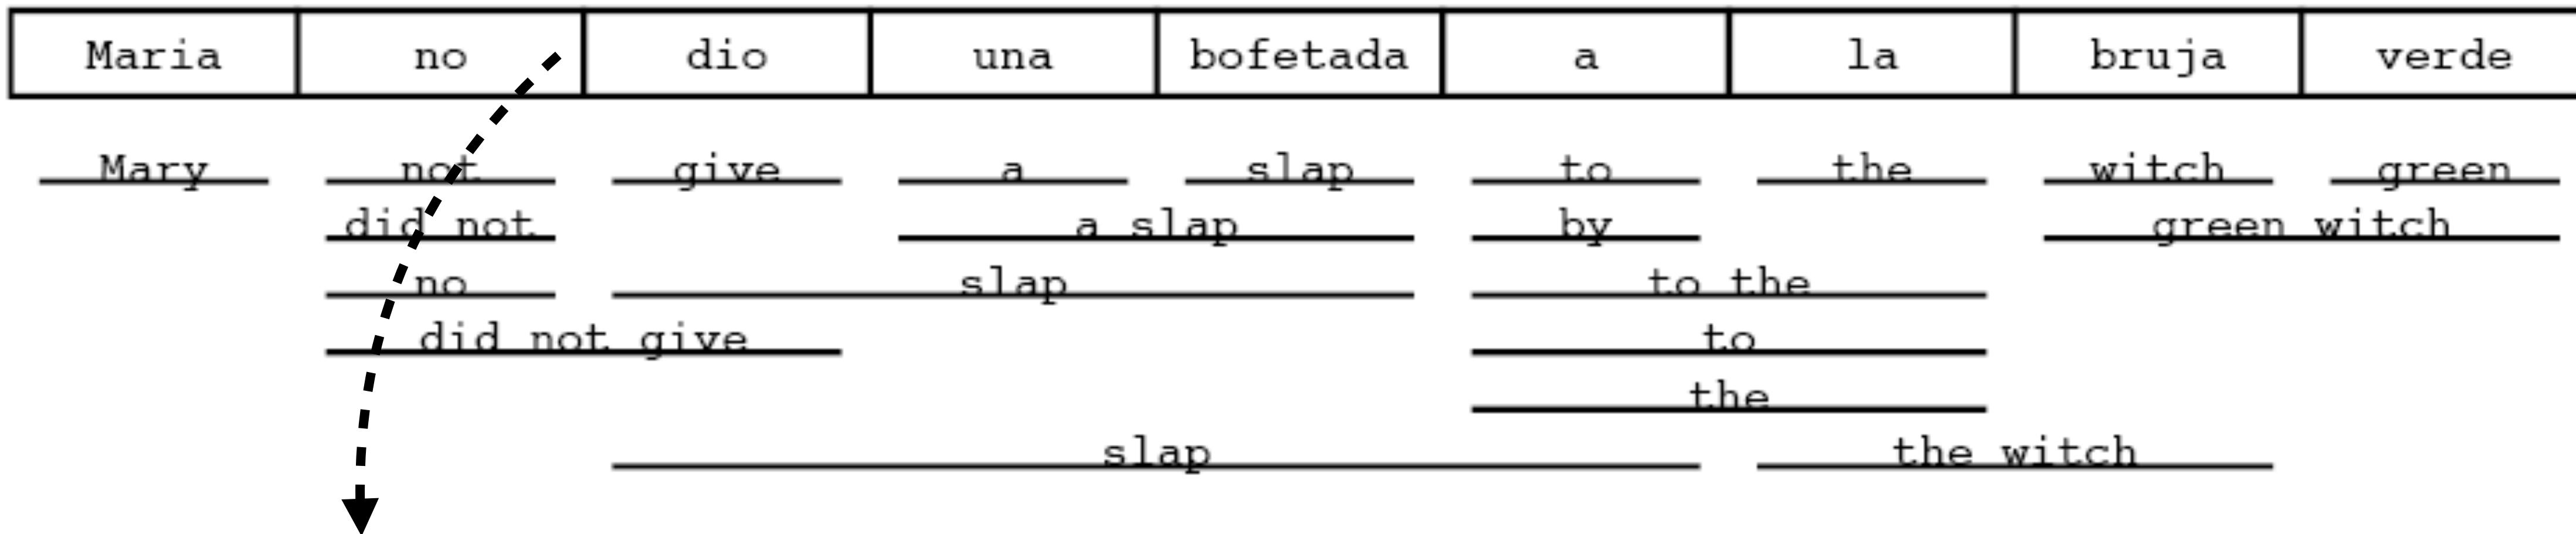

- ▶ An efficient search algorithm which aims to find high-probability sequences (not necessarily the optimal sequence, though)
- ▶ Core idea:
 - ▶ On each step of decoder, keep track of the k most probable partial sequences (which are called hypotheses).
 - ▶ k is the beam size.

Monotonic Translation

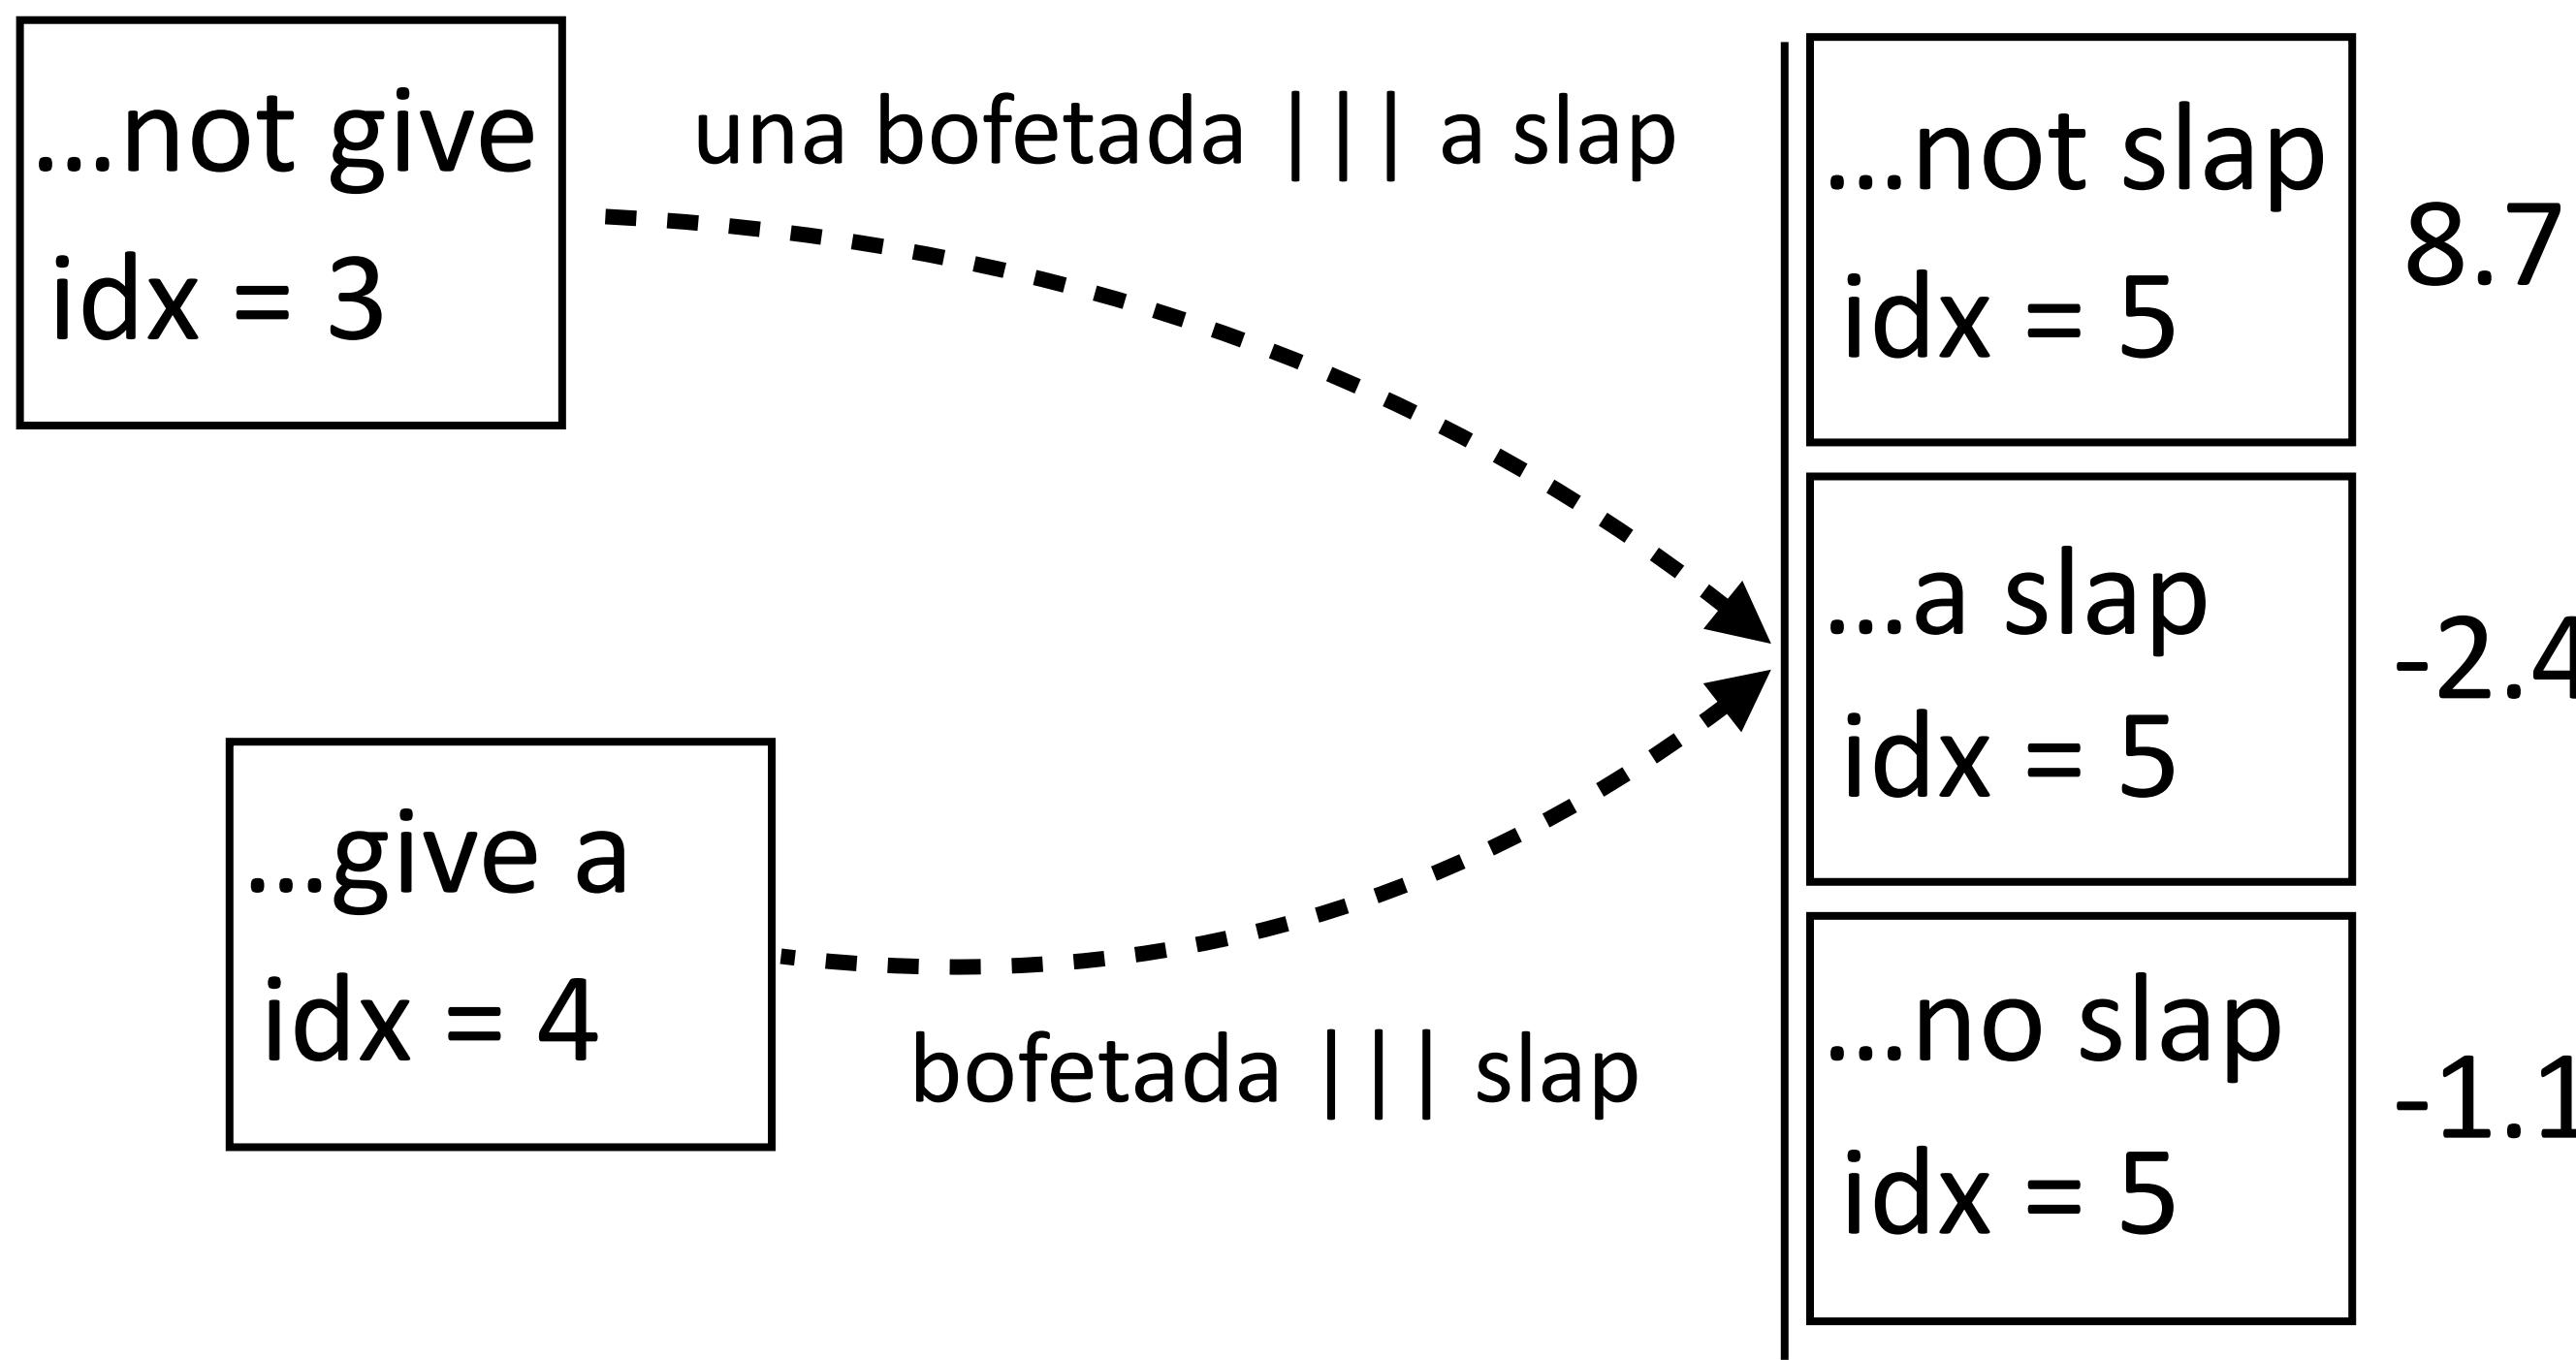

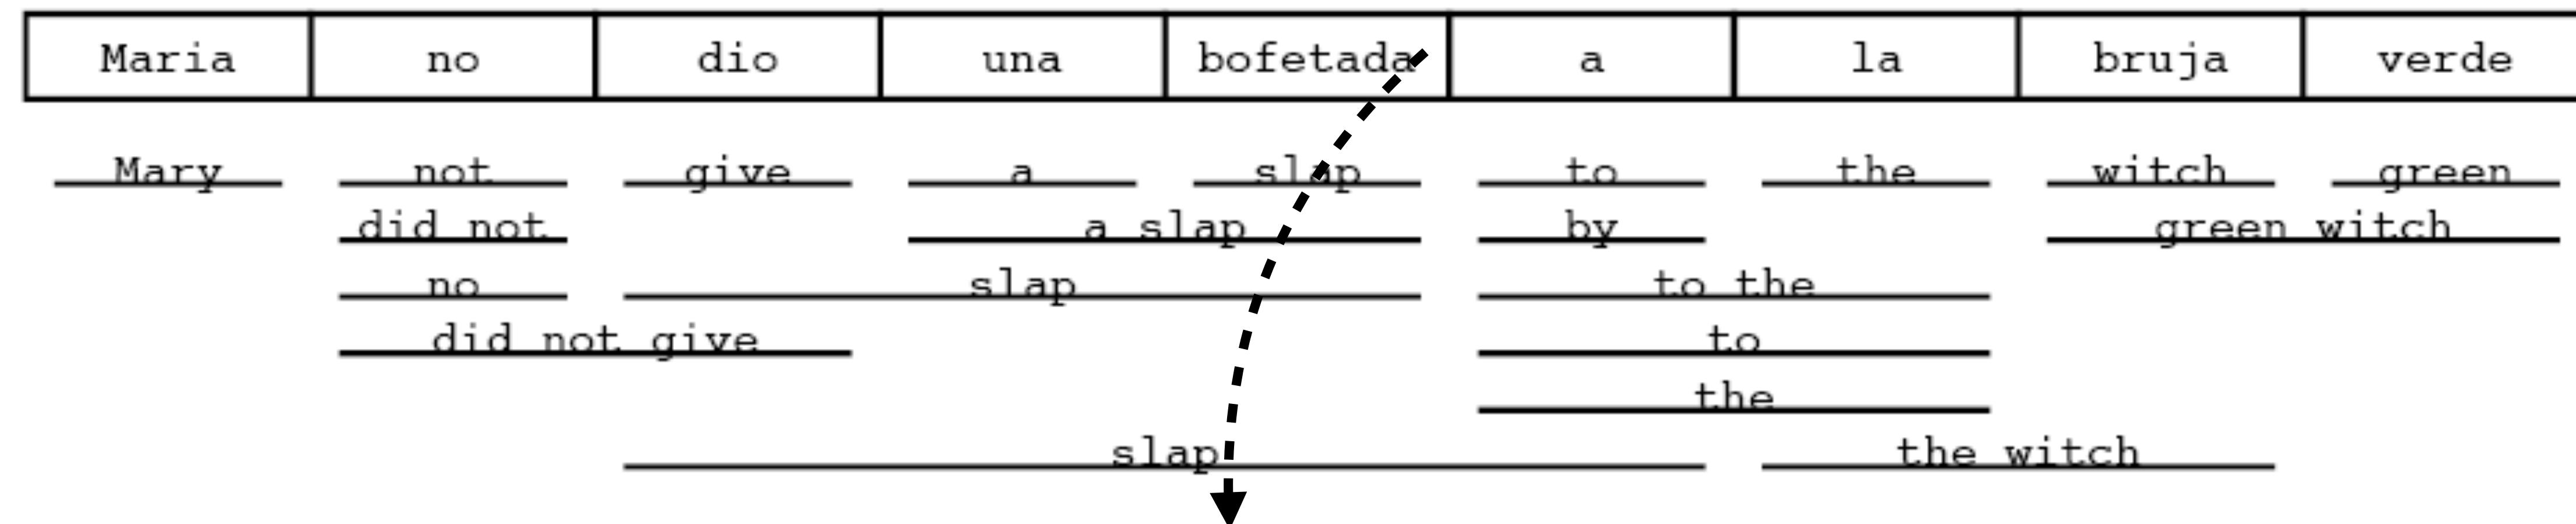

Maria	no	dio	una	bofetada	a	la	bruja	verde
<u>Mary</u>	<u>not</u>	<u>give</u>	<u>a</u>	<u>slap</u>	<u>to</u>	<u>the</u>	<u>witch</u>	<u>green</u>
	<u>did not</u>			<u>a slap</u>		<u>by</u>		<u>green witch</u>
	<u>no</u>		<u>slap</u>			<u>to the</u>		
		<u>did not give</u>				<u>to</u>		
						<u>the</u>		
				<u>slap</u>			<u>the witch</u>	

- ▶ If we translate with beam search, what state do we need to keep in the beam?
- ▶ What have we translated so far? $\arg \max_{\mathbf{e}} \left[\prod_{\langle \bar{e}, \bar{f} \rangle} P(\bar{f} | \bar{e}) \cdot \prod_{i=1}^{|\mathbf{e}|} P(e_i | e_{i-1}, e_{i-2}) \right]$
- ▶ What words have we produced so far?
- ▶ When using a 3-gram LM, only need to remember the last 2 words!

Monotonic Translation

Monotonic Translation

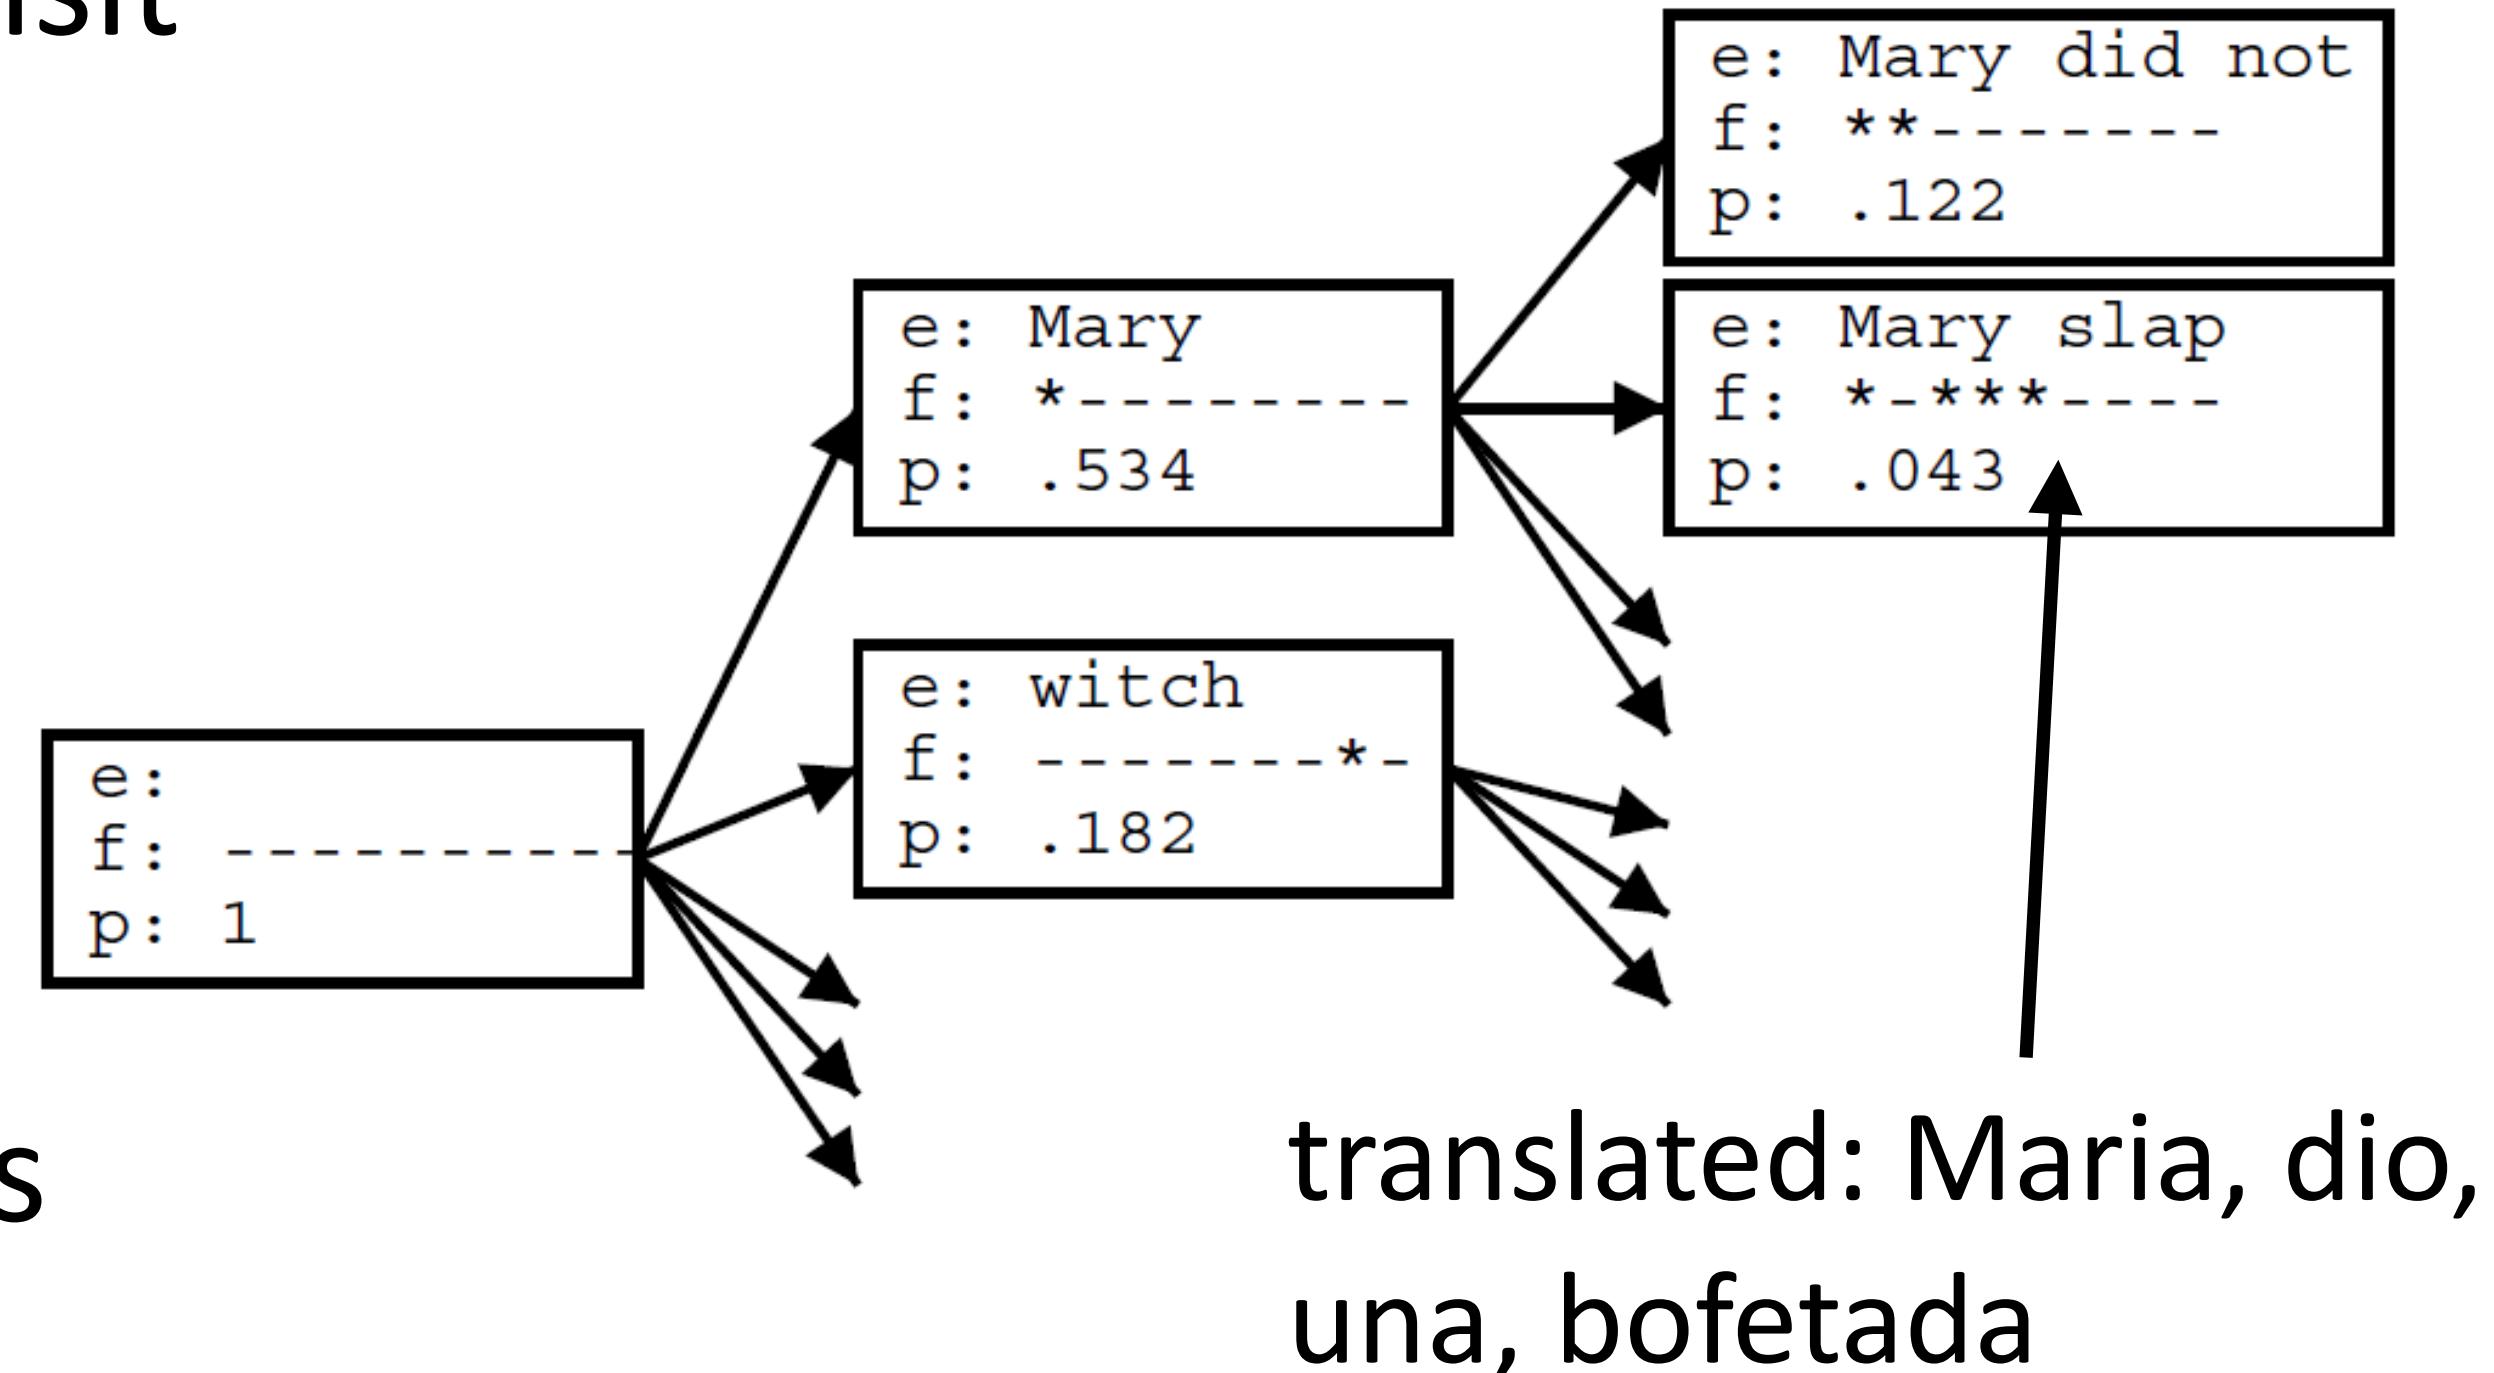

- ▶ Several paths can get us to this state, max over them (like Viterbi)

Non-Monotonic Translation

Maria	no	dio	una	bofetada	a	la	bruja	verde
<u>Mary</u>	<u>not</u>	<u>give</u>	<u>a</u>	<u>slap</u>	<u>to</u>	<u>the</u>	<u>witch</u>	<u>green</u>
	<u>did not</u>			<u>a slap</u>		<u>by</u>		<u>green witch</u>
	<u>no</u>			<u>slap</u>		<u>to the</u>		
						<u>to</u>		
						<u>the</u>		
							<u>the witch</u>	
				<u>slap</u>				

- ▶ Non-monotonic translation: can visit source sentence “out of order”
- ▶ State needs to describe which words have been translated and which haven’t
- ▶ Big enough phrases already capture lots of reorderings, so this isn’t as important as you think

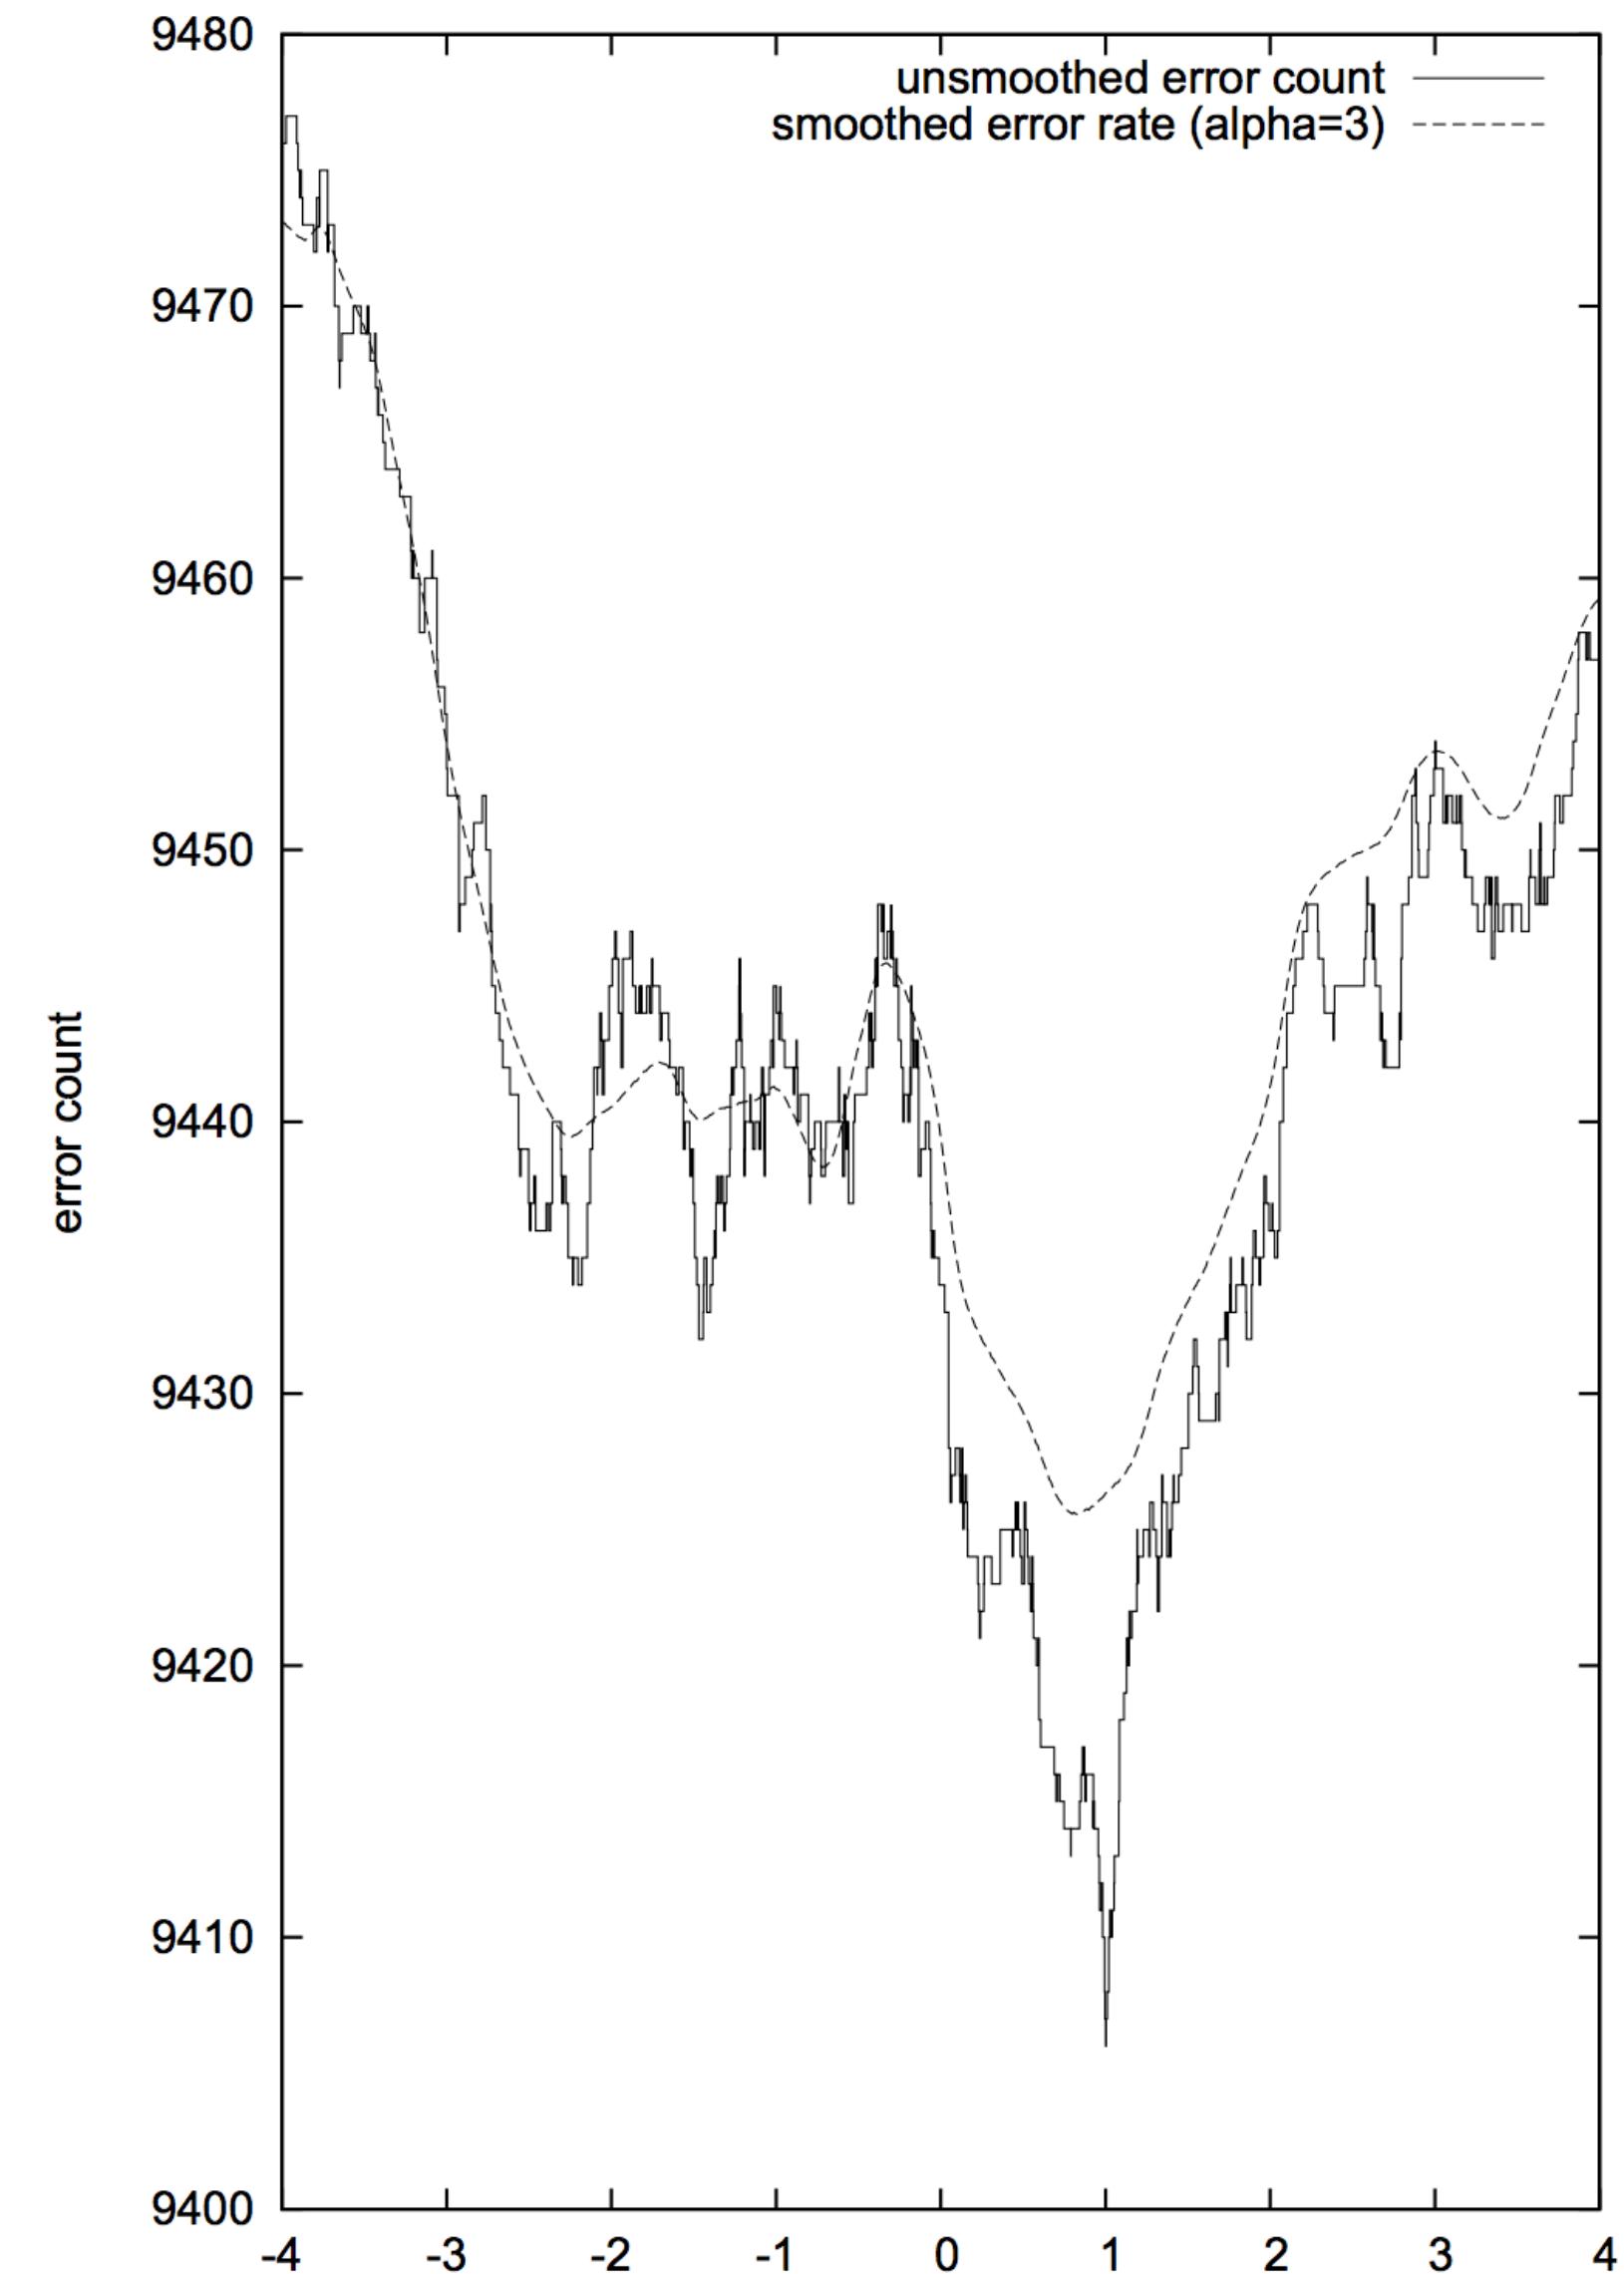

Training Decoders

$$\text{score} = \alpha \log P(\text{LM}) + \beta \log P(\text{TM})$$

...and TM is broken down into several feature

- ▶ Usually 5-20 feature weights to set, want to optimize for BLEU score which is not differentiable
- ▶ MERT (Och 2003): decode to get 1000-best translations for each sentence in a small training set (<1000 sentences), do line search on parameters to directly optimize for BLEU

Moses

- ▶ Toolkit for machine translation due to Philipp Koehn + Hieu Hoang
 - ▶ Pharaoh (Koehn, 2004) is the decoder from Koehn's thesis
- ▶ Moses implements word alignment, language models, and this decoder, plus *a ton* more stuff
 - ▶ Highly optimized and heavily engineered, could more or less build SOTA translation systems with this from 2007-2013

Syntax

Syntactic MT

- ▶ Rather than use phrases, use a *synchronous context-free grammar*

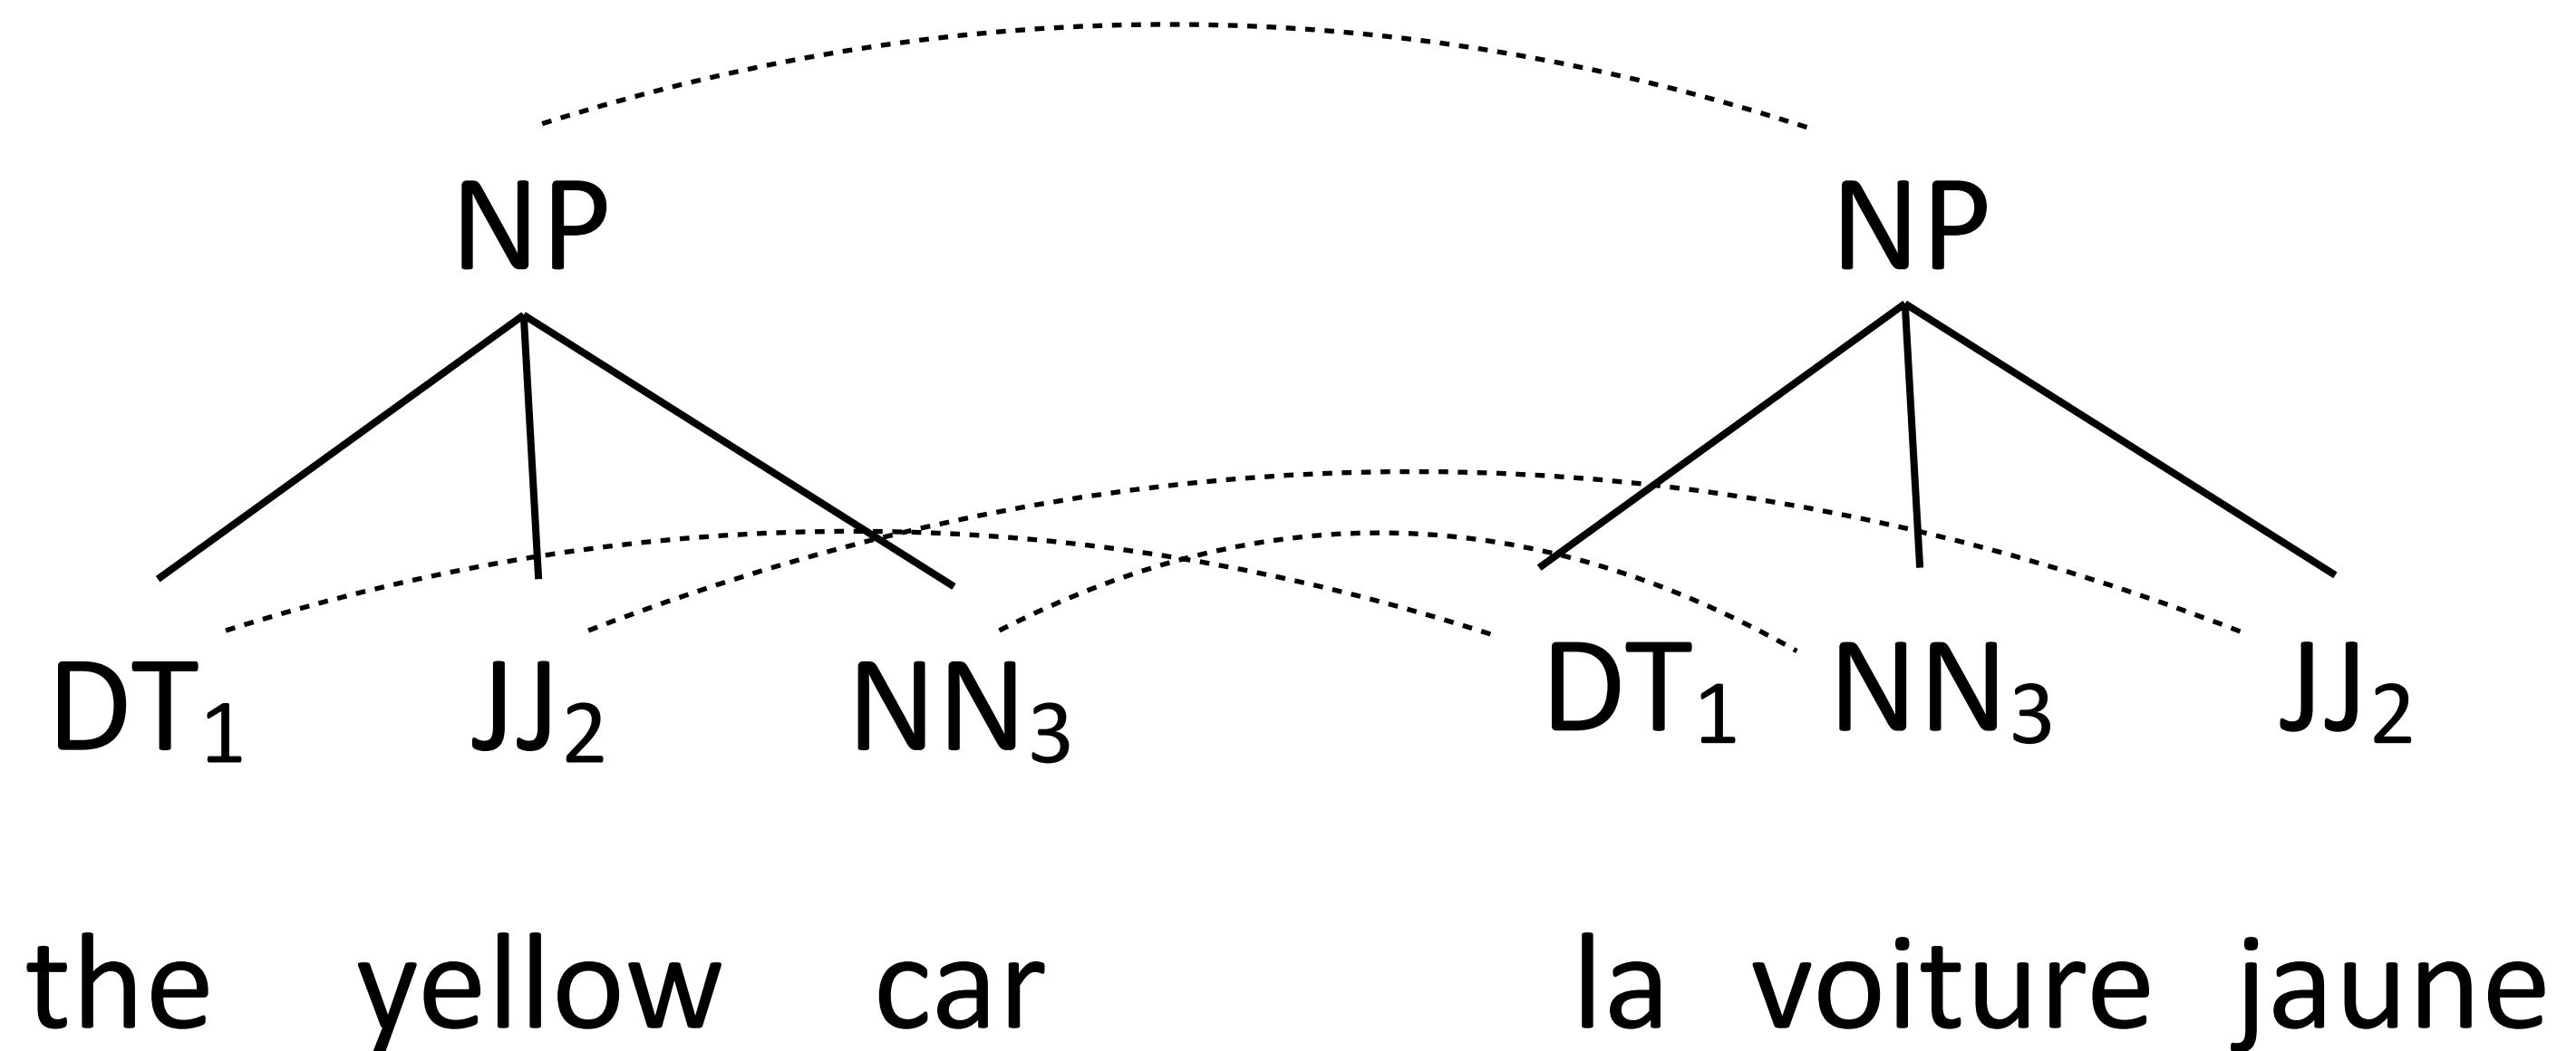

$NP \rightarrow [DT_1\ JJ_2\ NN_3; DT_1\ NN_3\ JJ_2]$

$DT \rightarrow [\text{the}, \text{la}]$

$DT \rightarrow [\text{the}, \text{le}]$

$NN \rightarrow [\text{car}, \text{voiture}]$

$JJ \rightarrow [\text{yellow}, \text{jaune}]$

- ▶ Translation = parse the input with “half” of the grammar, read off the other half
- ▶ Assumes parallel syntax up to reordering

Syntactic MT

- ▶ Rather than use phrases, use a *synchronous context-free grammar*

	Urdu	English
$S \rightarrow$	$NP\textcircled{1} VP\textcircled{2}$	$NP\textcircled{1} VP\textcircled{2}$
$VP \rightarrow$	$PP\textcircled{1} VP\textcircled{2}$	$VP\textcircled{2} PP\textcircled{1}$
$VP \rightarrow$	$V\textcircled{1} AUX\textcircled{2}$	$AUX\textcircled{2} V\textcircled{1}$
$PP \rightarrow$	$NP\textcircled{1} P\textcircled{2}$	$P\textcircled{2} NP\textcircled{1}$
$NP \rightarrow$	<i>hamd ansary</i>	<i>Hamid Ansari</i>
$NP \rightarrow$	<i>na}b sdr</i>	<i>Vice President</i>
$V \rightarrow$	<i>namzd</i>	<i>nominated</i>
$P \rightarrow$	<i>kylye</i>	<i>for</i>
$AUX \rightarrow$	<i>taa</i>	<i>was</i>

NP①

hamd ansary

NP②

na}b sdr

P③
|
kylye

V④

nominated

AUX⑤
|
was

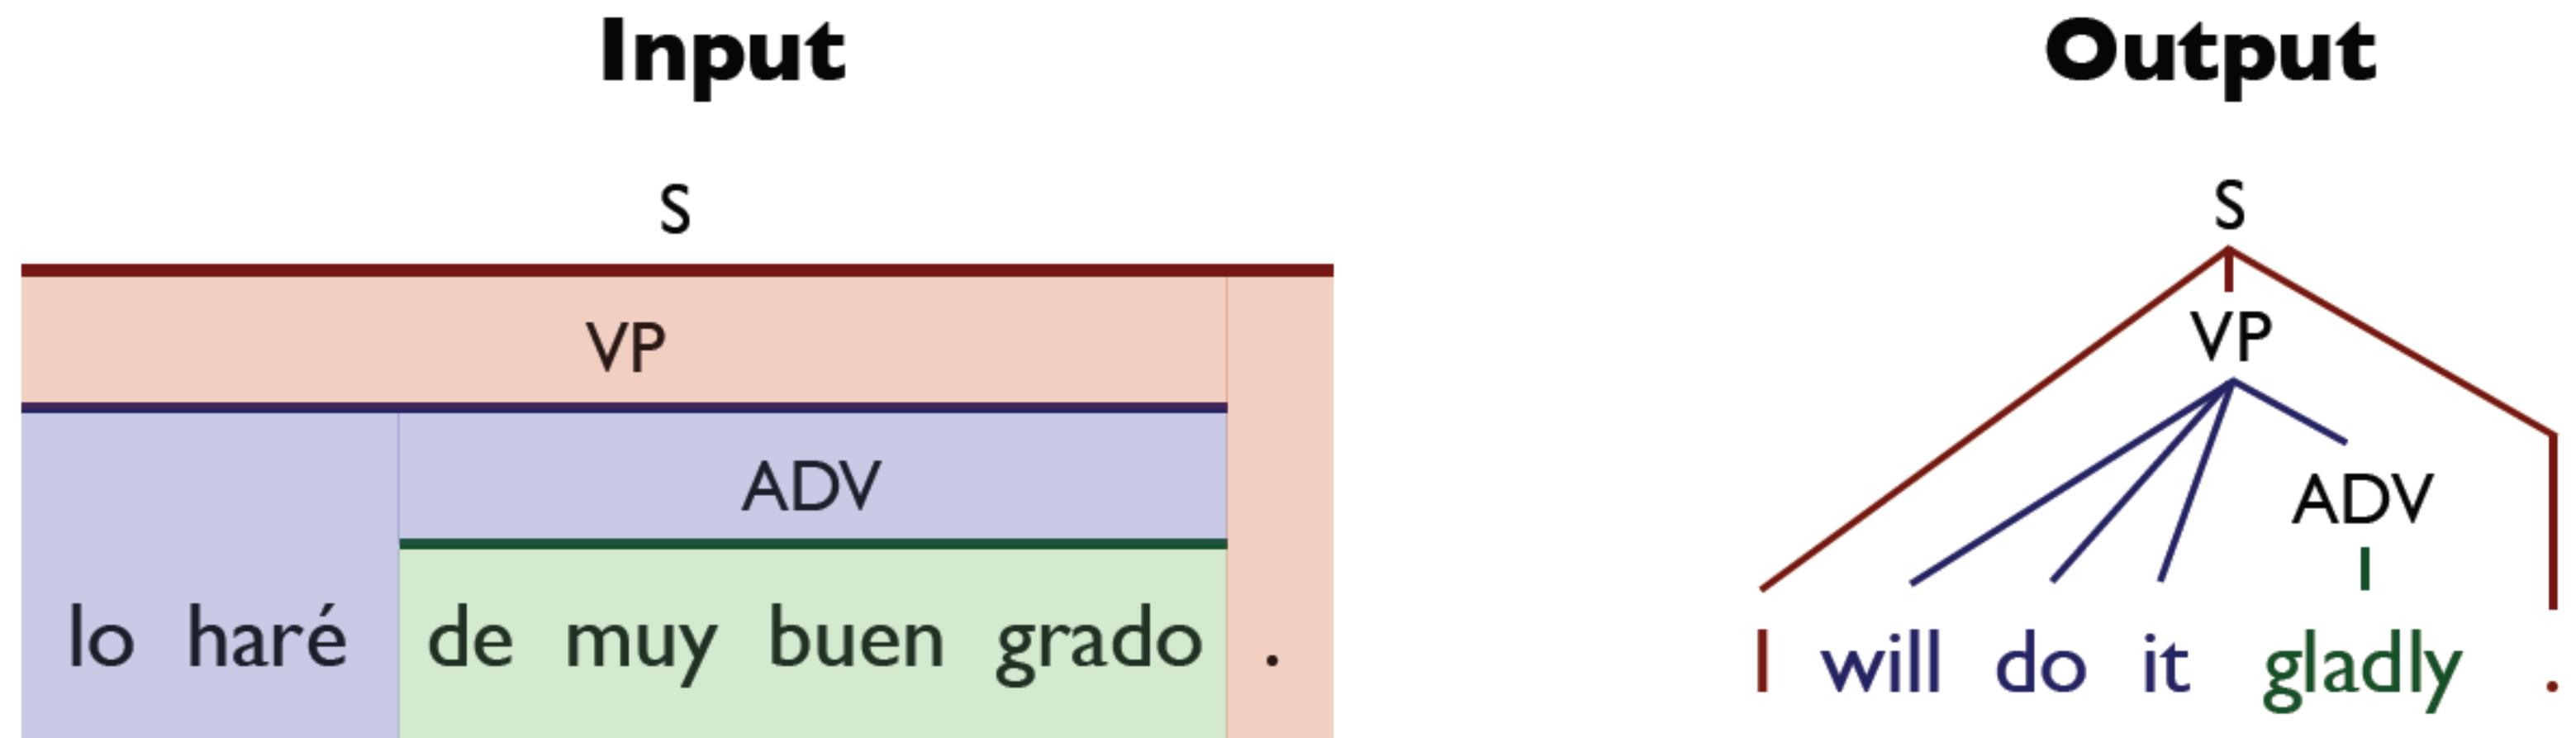

Syntactic MT

- ▶ Use lexicalized rules, look like “syntactic phrases”
- ▶ Leads to HUGE grammars, parsing is slow

Grammar

$s \rightarrow \langle VP . ; I VP . \rangle$ OR $s \rightarrow \langle VP . ; you VP . \rangle$

$VP \rightarrow \langle lo\haré\ ADV ; will\do\it\ ADV \rangle$

$s \rightarrow \langle lo\haré\ ADV . ; I\will\do\it\ ADV . \rangle$

$ADV \rightarrow \langle de\muy\buen\grado ; gladly \rangle$

Joshua

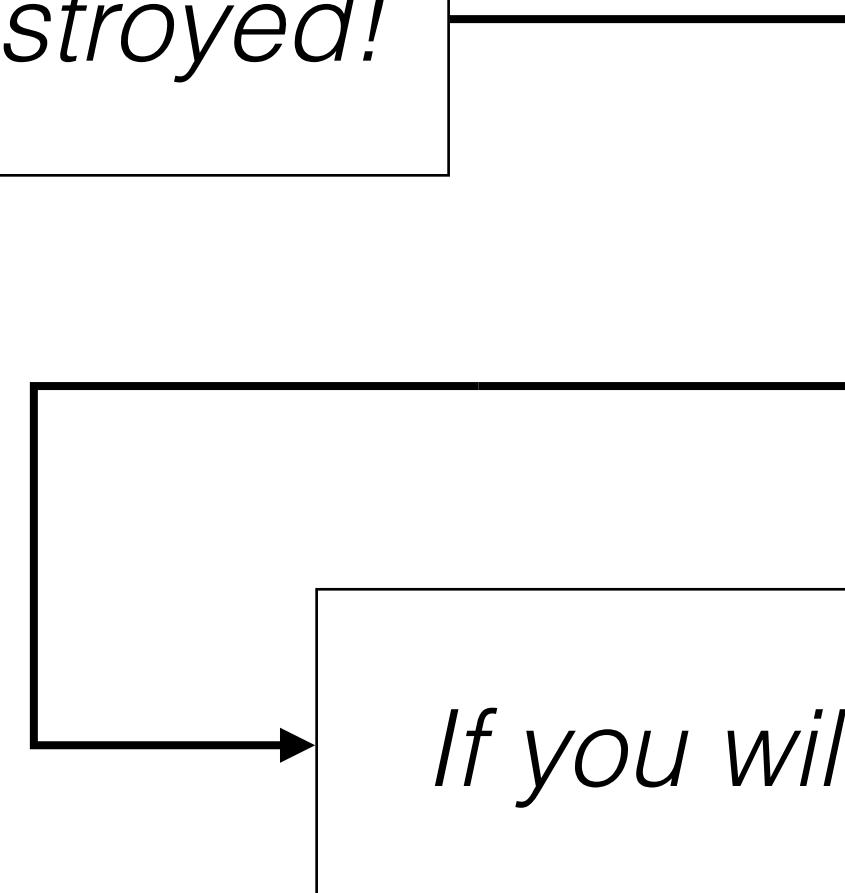

- ▶ Toolkit for syntactic machine translation due to many researchers at JHU (Weese, Ganitkevitch, Callison-Burch, Post, Lopez, ...)
- ▶ Joshua implements synchronized grammar extraction (Thrax!), parsing, language modeling, pruning , plus *a ton* more stuff
- ▶ Joshua uses two types of SCFG: Hiero grammar (Chiang, 2007), SAMT grammar (Zollmann & Venugopal, 2007)

Case Studies: Monolingual MT

Style Transfer

If you will not be turned, you will be destroyed!

If you will not be turn'd, you will be undone!

- Applied phrase-based MT (Moses Toolkit) to Shakespearean bitext

Text Simplification

Slightly more fourth-graders nationwide are reading proficiently compared with a decade ago, but only a third of them are now reading well, according to a new report.

transform

*Most fourth-graders are better readers than they were 10 years ago.
But few of them can actually read well.*

Text Simplification

Slightly more fourth-graders nationwide are reading proficiently compared with a decade ago, but only a third of them are now reading well, according to a new report.

transform

*Most fourth-graders are better readers than they were 10 years ago.
But few of them can actually read well.*

Text Simplification

Large-scale Paraphrases
(lexical, phrasal, syntactic)

Tuning Data
(crowdsourced multi-references)

Feature Functions
(readability, language modeling, etc.)

Objective Function

(Xu et al., 2016)

$$SARI = d_1 F_{add} + d_2 F_{keep} + d_3 P_{del}$$
$$p_{add}(n) = \frac{\sum_{g \in O} \min(\#_g(O \cap \bar{I}), \#_g(R))}{\sum_{g \in O} \#_g(O \cap \bar{I})}$$
$$r_{add}(n) = \frac{\sum_{g \in O} \min(\#_g(O \cap \bar{I}), \#_g(R))}{\sum_{g \in O} \#_g(R \cap \bar{I})}$$

Pairwise Ranking Optimization

$$\begin{aligned} g(i, j) > g(i, j') &\Leftrightarrow h_w(i, j) > h_w(i, j') \\ &\Leftrightarrow h_w(i, j) - h_w(i, j') > 0 \\ &\Leftrightarrow w \cdot x(i, j) - w \cdot x(i, j') > 0 \\ &\Leftrightarrow w \cdot (x(i, j) - x(i, j')) > 0 \end{aligned}$$

- Implemented by modifying 4 major components of syntax-based MT (Joshua Toolkit); SARI is now part of tensor2tensor library.

SARI for Text-to-Text Generation

- ← using SARI for sentence splitting and fusion
- ← using SARI for sentence decontextualization:
taking a sentence together with its context and
rewriting it to be interpretable out of context,
while preserving its meaning
- ← using SARI for revising claims based on facts
correlates well with human judgements!

Takeaways

- ▶ Phrase-based systems consist of 3 pieces: aligner, language model, decoder
 - ▶ HMMs work well for alignment
 - ▶ N-gram language models are scalable and historically worked well
 - ▶ Decoder requires searching through a complex state space
- ▶ Lots of system variants incorporating syntax
- ▶ Next: neural MT
